

Radio Shack

**TRS-80[®]
MODEL 16**

**TRSDOS[™]-16
DISK OPERATING
SYSTEM**

Limited Warranty Information

I. CUSTOMER OBLIGATION

A. CUSTOMER assumes full responsibility that this computer hardware, (the "Equipment") and/or software (the "Software") meets the specifications, capacity, capabilities, versatility, and other requirements of CUSTOMER.

B. CUSTOMER assumes full responsibility for the condition and effectiveness of the operating environment in which the Equipment and Software is to function, and for its installation.

II. RADIO SHACK LIMITED WARRANTIES AND CONDITIONS OF SALE

A. For a period of ninety (90) calendar days from the date of the Radio Shack sales ticket, RADIO SHACK warrants to the original CUSTOMER that the Equipment and the cassettes and/or diskettes containing software programs are free from defects. This warranty is only applicable to purchases from RADIO SHACK company-owned Computer Centers, retail stores and through RADIO SHACK franchisees and dealers. The warranty is void if the unit's case or cabinet has been opened, or if the unit has been subjected to improper or abnormal use. If a defect occurs during the warranty period, the defective Equipment must be returned to a Radio Shack Computer Center, a Radio Shack retail store, participating franchisee or dealer for repair, along with a copy of the sales ticket or lease agreement. The original CUSTOMER'S sole and exclusive remedy in the event of a defect is limited to the correction of the defect by repair, replacement, or complete refund, at RADIO SHACK'S election and sole expense. RADIO SHACK has no obligation to replace or repair expendable items.

B. RADIO SHACK makes no warranty as to the design, capability, capacity, or suitability for use of the Equipment or Software. Software is licensed on an "AS IS" basis, without warranty. CUSTOMER'S exclusive remedy, in the event of a software defect is its repair or replacement within thirty (30) calendar days of the date of purchase upon its return to a Radio Shack Computer Center, Radio Shack retail store, participating franchisee or dealer along with the sales ticket.

C. Except as provided herein no employee, agent, franchisee dealer or other person is authorized to give any warranties of any nature on behalf of RADIO SHACK.

D. Except as provided herein, RADIO SHACK MAKES NO WARRANTIES, INCLUDING WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

F. Some states do not allow limitations on how long an implied warranty lasts, so the above limitation(s) may not apply to CUSTOMER.

III. LIMITATION OF LIABILITY

A. EXCEPT AS PROVIDED HEREIN, RADIO SHACK SHALL HAVE NO LIABILITY OR RESPONSIBILITY TO CUSTOMER OR ANY OTHER PERSON OR ENTITY WITH RESPECT TO ANY LIABILITY, LOSS OR DAMAGE CAUSED OR ALLEGED BE CAUSED DIRECTLY OR INDIRECTLY BY "EQUIPMENT" OR "SOFTWARE" SOLD, LEASED, LICENSED OR FURNISHED BY RADIO SHACK, INCLUDING, BUT NOT LIMITED TO, ANY INTERRUPTION OF SERVICE, LOSS OF BUSINESS OR ANTICIPATORY PROFITS OR CONSEQUENTIAL DAMAGES RESULTING FROM THE USE OR OPERATION OF THE "EQUIPMENT" OR "SOFTWARE." IN NO EVENT SHALL RADIO SHACK BE LIABLE FOR LOSS OF PROFITS, OR ANY INDIRECT, SPECIAL, OR CONSEQUENTIAL DAMAGES ARISING OUT OF ANY BREACH OF THIS WARRANTY OR IN ANY MANNER ARISING OUT OF OR CONNECTED WITH THE SALE, LEASE, USE OR ANTICIPATED USE OF THE "EQUIPMENT" OR "SOFTWARE".

NOTWITHSTANDING THE ABOVE LIMITATIONS AND WARRANTIES, RADIO SHACK'S LIABILITY HEREUNDER FOR DAMAGES INCURRED BY CUSTOMER OR OTHERS SHALL NOT EXCEED THE AMOUNT PAID BY CUSTOMER FOR THE PARTICULAR "EQUIPMENT" OR "SOFTWARE" INVOLVED.

B. RADIO SHACK shall not be liable for any damages caused by delay in delivering or furnishing any Equipment or Software.

C. No action arising out of any claimed breach of this WARRANTY or transactions under this WARRANTY may be brought more than two (2) years after the cause of action has accrued or more than four (4) years after the date of the Radio Shack sales ticket for the Equipment or Software whichever first occurs.

D. Some states do not allow the exclusion or limitation of incidental or consequential damages, so the above limitation(s) or exclusion(s) may not apply to CUSTOMER.

IV. RADIO SHACK SOFTWARE LICENSE

RADIO SHACK grants to CUSTOMER A non-exclusive, paid-up license to use the RADIO SHACK application or system Software and/or the RADIO SHACK system Software (including firmware) installed in or provided with the Equipment on one computer, subject to the following provisions:

A. Except as otherwise provided in this Software License, applicable copyright laws shall apply to the Software.

B. Title to the medium on which the Software is recorded (cassette and/or diskette) or stored (ROM) is transferred to CUSTOMER, but not title to the Software.

C. CUSTOMER shall not use, make, manufacture, or reproduce copies of Software except for use on one computer and as is specifically provided in this Software License.

D. CUSTOMER is permitted to make additional copies of the Software only for backup or archival purposes or if additional copies are required in the operation of one computer with the Software, but only to the extent the Software allows a backup copy to be made.

E. CUSTOMER may resell or distribute unmodified copies of the Software provided CUSTOMER has purchased one copy of the Software for each one sold or distributed. The provisions of this Software License shall also be applicable to third parties receiving copies of the Software from CUSTOMER.

F. All copyright notices shall be retained on all copies of the Software.

V. APPLICABILITY OF WARRANTY

A. The terms and conditions of this WARRANTY are applicable between RADIO SHACK and CUSTOMER to either a sale of the Equipment and/or Software License to CUSTOMER or to a transaction whereby RADIO SHACK sells or conveys such Equipment and/or Software to a third party for lease to CUSTOMER.

B. The limitations of liability and warranty provisions herein shall insure to the benefit of RADIO SHACK, the owner and/or licensor of RADIO SHACK Software to RADIO SHACK, and any author or manufacturer of computer hardware or Equipment sold or Software licensed by RADIO SHACK.

VII. STATE LAW RIGHTS

The warranties granted herein give the original CUSTOMER specific legal rights, and the original CUSTOMER may have other rights which vary from state to state.

ADDENDUM
April 21, 1982

Please make the following corrections to your manuals:

SWAPPING DISKETTES

Operator's Read Me First Manual
page 30.

The Model 16 Disk Operating System Owner's Manual
Section II, page 21.

Model II Owner's Manual Supplement
Section Four, Part II, page 48.

When you swap a single-sided diskette to a double-sided diskette (or double-sided to single-sided) in Drive 0, it is necessary to press the RESET switch after swapping the diskettes.

SPOOLER and DO Files

The Model 16 Disk Operating System Owner's Manual
Section II, page 40 and 80; Section III, page 180

You may not execute the SPOOL command and a DO file at the same time. The first one executed will be given priority over the second.

HELP

The Model 16 Disk Operating System Owner's Manual
Section II, page 58.

The HELP command displays only the TRSDOS-II commands and syntaxes. This will be corrected in a future release of TRSDOS-16.

RESTORE

The Model 16 Disk Operating System Owner's Manual
Section II, page 72.

Model II Owner's Manual Supplement
Section Four, Part II, page 60.

The ALL option of RESTORE is not available. Specifying a drive number as both the source and destination will retrieve all non-system files.

For example, the command RESTORE 0 TO 4 <ENTER> would restore all non-system files from the diskette in Drive 0 to Drive 4.

KBCHAR SVC
(function code 4)

The Model 16 Disk Operating System Owner's Manual
Section III, page 164.

The Exit Conditions have been changed to the following:

Byte-Offset	2-3	<u>error code</u>
	6-7	<u>character present flag</u>
	8-9	<u>returned character</u>

CONFIG16/SYS

The Model 16 Disk Operating System Owner's Manual
Section III, page 164.

Assembler-16 Programming Package
Appendix D, page 336.

The CONFIG16/SYS file on your TRSDOS-16 diskette does not include the RUNCOBOL file as stated.

Thank You!

Radio Shack
Part Number 8759155

INTRODUCTION

WHAT IS AN OPERATING SYSTEM?

An operating system is a low level program which monitors and controls your entire computer system.

This includes the Model 16's two microprocessors, as well as the disk drives, keyboard, printer, and all other equipment.

It is the operating system which enables you to use application programs (such as PAYROLL, PROFILE, and MAILING LIST II.)

WHAT IS TRSDOS-16?

TRSDOS-16 is one of the three operating systems you can use with your Model 16.

It uses both of the Model 16's microprocessors -- the Z80 and the MC68000. All Model 16 application programs are designed to run under TRSDOS-16.

If you've read the Operator's Manual, you know about the other two operating systems -- TRSDOS and TRSDOS-II. They use only the Z80 microprocessor and are for Model II mode programs.

ABOUT THIS MANUAL

This manual shows how you can use the TRSDOS-16 operating system to:

- . write Model 16 programs
- . store, retrieve or manipulate information on disk.

In the Operator's Read Me First Manual, we covered all the essential information to get you started. This means if you're not a programmer, you do not need to read this manual.

If you are a programmer, you'll find a lot of useful information in this manual:

SECTION I/ USING TRSDOS-16 describes how to start-up TRSDOS-16, what TRSDOS-16 Ready means, and some general information on how TRSDOS-16 works.

SECTION II/ TRSDOS-16 SYSTEM COMMANDS contains a number of commands you will find helpful.

SECTION III/ TECHNICAL INFORMATION explains how to use TRSDOS-16 on a technical level. Besides providing useful technical information, this section lists many TRSDOS-16 routines (called supervisor calls or SVCs) which you can call from your machine-language program.

SECTION IV/ THE APPENDICES contains more information, including memory maps, error messages, and codes useful in writing programs.

This manual describes TRSDOS-16 only. If you have a new Model 16 and need information on TRSDOS and TRSDOS-II (the Model II operating systems), see your Owner's Manual/Model II Mode.

If you have an Enhanced Model II, see the Model II Owner's Manual for information on TRSDOS and the Supplement to the Model II Owner's Manual for information on TRSDOS-II.

NOTATIONS

For clarity and brevity, we use some special notations and type styles in this book.

CAPITALS and punctuation indicate material that you must enter exactly as it appears or material that you see on your Computer's video display.

<KEYBOARD CHARACTER>
indicates keys you press.

lowercase underlined
represent words, letters, characters or values.

H'nnnn
specifies nnnn as a hexadecimal (base 16) number. All other numbers in the text of this book are in decimal (base 10) form, unless otherwise noted.

TERMS

Below is a listing of terms which we use frequently in this manual. The underlined words represent variable information which you must supply.

command represents the TRSDOS-16 command you want to execute.

comment is an optional field used to document the purpose of the command line.

{options} is a list of one or more parameters that may be needed by the command. Some commands have no options. The braces { } around options can usually be omitted if you don't use a comment at the end of the command line.

filespec is a standard TRSDOS-16 file specification having the general form:
filename/ext.password:drive(disk name)

hard disk refers exclusively to a hard disk (Drives 4 - 7).

diskette refers exclusively to a floppy diskette
(Drives 0 - 3).

disk refers to a disk that can be either a hard disk or
a floppy diskette (Drives 0 - 7).

primary drive refers to the disk drive that contains the
operating system information (Drive 0 or 4).

INTRODUCTION

HOW THE COMPUTER USES TRSDOS-16

Whenever you are using a Model 16 program, your computer will, from time to time, need to reference TRSDOS-16. It always looks for TRSDOS-16 on the primary drive.

The primary drive is:

Drive 0 -- if you start up your system under floppy disk control

Drive 4 -- if you start up your system under hard disk control. (It may be your only hard disk drive)

For this reason, if you have a floppy disk system (that is, you don't have the optional hard disk) or if you have a hard disk system and are operating under floppy disk control, you must at all times have a diskette containing TRSDOS-16 in Drive 0.

If you have a hard disk system and want to operate under the control of your hard disk, you need to copy TRSDOS-16 onto your primary drive. The Operator's Read Me First Manual shows how.

LOADING TRSDOS-16

When you install and power up your system, you'll see the TRSDOS-II start-up logo. This means you're in the TRSDOS-II 4.1 Operating System (the Model II mode). You then need to enter the date and time. Enter the date in the form MM/DD/YYYY form. For example, type:

```
08/21/1982 <ENTER>
```

for August 21, 1982. You now will be prompted to enter the time. You can skip this question by simply pressing <ENTER>. The time will start at 00.00.00.

If you want to set the time, type the time in the 24-hour format -- HH.MM.SS. The seconds are optional. For example, type:

```
14.30 <ENTER>
```

for 2:30 pm.

After entering the date and time, the TRSDOS-16 Operating System AUTOMATICALLY loads and displays:

```
TRSDOS-16 Ready
```

This indicates that you are at the 68000 Disk Operating System's command level.

NOTE: A factory-set AUTO command loads the TRSDOS16/SYS program -- the 68000 operating system. It then loads a configuration command file named CONFIG16/SYS which links certain extra operating system modules into memory. If you want to save memory or change the configuration command file, see Appendix B.

To override this factory-set AUTO command, see AUTO in SECTION II.

You can also load TRSDOS-16 from the TRSDOS-II Ready prompt by typing:

```
BOOT16 TRSDOS16/SYS <ENTER>
```

WARNING: DO NOT press <BREAK> when you are loading the TRSDOS-16 operating system. If you do, your computer may become confused if interrupted while doing the configuration.

If you accidentally press <BREAK>, you will have to power down your system before trying to load TRSDOS-16 again.

WHAT DOES TRSDOS-16 READY MEAN?

Whenever you see the TRSDOS-16 Ready prompt you know that you are in control of TRSDOS-16 -- not COBOL, PAYROLL, or any of your application programs. Being in control of TRSDOS-16 allows you to do one of these operations:

- . execute a system command
- . execute a program

If you want to perform any other operation, you need to be in control of an application program.

When you are in control of TRSDOS-16 and an error occurs, you'll get one of the error messages listed in Appendix A.

If you get an error message not listed, it came from an application program that is running. You'll need to see the manual which came with the application program for an explanation of the error message.

EXECUTING A COMMAND

You can execute a TRSDOS-16 system command whenever you see the TRSDOS-16 Ready prompt. The command you type can consist of up to 80 characters. You must end the command by pressing <ENTER>.

For example, if you want to see the TRSDOS-16 system commands, type:

```
LIB <ENTER>
```

TRSDOS-16 displays a list of all the available system commands and returns to TRSDOS-16 Ready:

APPEND	ASSIGN	ATTRIB	AUTO	BACKUP	CLEAR	CLS	COPY
CREATE	DATE	DEBUG	DIR	DISMOUNT	DO	DRIVE	DUMP
EXEC	FCOPY	FILES	FLOPPY	FORMAT	FORMS	FREE	HELP
KILL	LIB	LIST	LOAD	MOUNT	MOVE	MSG	PATCH
PAUSE	PRINT	LIST	PURGE	RELEASE	RENAME	RESET	RESTORE
SAVE	SETCOM	SIZE	SPOOL	TERMINAL	TIME	VERIFY	VERSION

EXECUTING A PROGRAM

You can also execute a program (such as the Editor) at the TRSDOS-16 Ready prompt. If what you enter is not a recognized system command, TRSDOS-16 checks to see if it is the name of a 68000 program. It checks for the program file on all drives, beginning with the primary drive (Drive 0 or Drive 4) unless you specify drive number.

If TRSDOS-16 finds a matching 68000 program file, it loads and executes the file. Otherwise, you get an error message. For example:

EDIT16 <ENTER>

loads the Editor program. Now you can create a program or edit an existing one.

DISK FILES

You can keep a record of anything you type into your Model 16 by storing it on disk (hard or floppy) in a "disk file". A disk file can contain a program, a collection of data, a project report you intend to make, or almost anything you want it to contain. But, whatever it is, if you want to keep it permanently, you'll have to store it in a disk file.

When the computer stores the file, it indexes the name of the file and it's disk location in a special place on the disk called the disk's directory. Whenever you want to access the file, the computer can immediately find its location by using this directory.

If you want to see how a disk file is created and stored, see the SAMPLE EXERCISE/ CREATING A DISK FILE later in this chapter.

FILESPEC

Whenever you create a disk file, you need to give it a name. This name is just one part of a file specification -- filespec, for short. The filespec is the standard TRSDOS-16 format you'll use every time you reference your file:

filename/ext.password:drive(disk name)

filename

The name of your file can be anything you like, as long as it is one to eight alphanumeric characters, the first of which must be a letter. For example, if you want to save a file containing an inventory list, you could simply name it:

INVNTRY

extension

If you want to further identify your file, you can give it a second name by adding an extension. An extension (indicated

by /ext on our filespec) is a sequence of one to three alphanumeric characters with a preceding slash (/).

You can use an extension to provide additional information on a file. For example, with an extension such as /NEW, /IRS, or /PAY, you could distinguish files with the same name or divide files into categories.

You can also use an extension to indicate the type of file you have. The extension /BAS indicates a BASIC program file; /DAT indicates that a file contains data only; or /SRC defines a SOURCE file.

With the extension /DAT, the new name of our inventory file is:

INVNTRY/DAT

password

Some files allow you to protect them. You can accomplish this protection via a password either when you create the file or with the command ATTRIB.

A password is a sequence of up to eight alphanumeric characters, the first of which must be a letter, with a period (.) preceding it to separate it from the filename.

There are two levels of passwords and the protection they provide -- access passwords and update passwords. These passwords not only can inhibit entry to a file, they also can provide protection at varying levels.

When you initially create a file and assign a password, the access and update passwords are the same. Later, if you choose, you can change these values with the system command ATTRIB and thus provide the additional protection to your files. (See ATTRIB for details.)

With the password Sesame, the new name of our inventory file is:

INVNTRY/DAT.Sesame

drive

Often when you're using your computer, you'll have more than one disk in use. Whether these disks are floppy or hard, you can speed up the file access time by specifying the

drive the desired file is on. Use the form :drive for the drive number.

If you omit a drive number on the filespec, your computer automatically starts looking for the file on all available drives, beginning with the primary drive.

To indicate your inventory file's location on the filespec, type:

```
INVNTRY/DAT.Sesame:2
```

See your Operator's Read Me First Manual (Model 16), Hard Disk Owner's Manual, or Operations Manual (Enhanced Model II) if you are not sure what your drive numbers are.

disk name

You may want to indicate the name of the disk that a file is on. The disk name was assigned when you formatted or backed up the disk.

It takes the form (disk name), which is a field of up to eight alphanumeric characters, the first character being a letter, with parentheses () surrounding the entire name. If you specify the disk name, you must also specify the drive number.

Now, if you're ready to reference your inventory file, enter this complete filespec to ensure that you're getting the right one:

```
INVNTRY/DAT.Sesame:2(WREHSE)
```

Of course, every filespec you enter won't include all of these optional specifications, however, you can use any combination of the fields as long as you follow the guidelines indicated.

Here are some more examples of valid TRSDOS-16 filespecs:

```
DOPROG.OPEN  
CLR/BAS:1  
MOD16:4(TRSDOS16)  
STL12/TXT.Arch:1(TRAVL82)  
GAME1  
THESIS/OLD:2  
CONTEMP:3
```

Wildcards

Certain system commands and SVC's allow you to specify a collection of files by using a "wildcard" mask. An asterisk "*" in a file specification represents a wildcard field and means "any sequence of zero or more characters". For example:

```
*/BAS:1
```

represents all the files stored on the diskette in Drive 1 having the extension /BAS.

```
D*
```

represents all the files on the disk in the primary drive, beginning with D, without extensions.

As an example use, if you want a DIRectory of all the files with an extension that begin with the letter D, type:

```
DIR D*/* <ENTER>
```

TRSDOS-16 returns a listing of all the files beginning with D and having extensions:

Disk Name:TRSDOS	Drive:4		04/09/82		00,25,35			
File Name	Created	Updated	Atrb	File	Rec	# of	----Sectors--	
	MM/DD/YY	MM/DD/YY		Typ	Len	Records	Alloc	Used
DATM32/TXT	04/09/82	04/09/82	D*X0	V	+++	+++	1	1
DOBUDGET/SRC	04/09/82	04/09/82	D*X0	V	+++	+++	1	1
DEMOPROG/1	04/09/82	04/09/82	D*X0	V	+++	+++	1	1
DIRECAC/FLE	04/09/82	04/09/82	D*X0	V	+++	+++	1	1

4 Files Displayed

Super Wildcard

Besides the wildcard "*", TRSDOS-16 has a super wildcard -- "!". You can use it to specify all files, with and without extensions.

For example, if you want to FCOPY all files from a diskette to hard disk, you can use the super-wildcard. This accomplishes in one step what it would take the wildcard two steps to do:

```
FCOPY */*:1 TO 4 <ENTER>
FCOPY *:1 TO 4 <ENTER>
```

Here, the first command FCOPYs files with extensions. The second then FCOPYs files without extensions. But, if you use the super wildcard and type:

```
FCOPY !:1 TO 4 <ENTER>
```

TRSDOS-16 FCOPYs all files on the diskette in Drive 1 to hard disk in one step.

You can use the wildcard and super wildcard with these system commands:

```
DIRectory
FCOPY
KILL
MOVE
```

SAMPLE EXERCISE/ CREATING A DISK FILE

This is an example of how to create a command file and then save it to disk. When run, the file will automatically clear the screen and print the date and time in the top left hand corner of the screen. This command file -- known as a DO-file -- is a program made up of one or more system commands or programs that is executed with the command DO.

To create this file, you must first enter the Editor and its Insert mode by typing:

```
EDIT16 <ENTER>
IN <ENTER>
```

(See the DO command in this manual for further information.) Now you should be in the insert mode (with the prompt I?) where you can type in the command lines:

```
CLS <ENTER>
MSG "TODAY'S DATE IS:" <ENTER>
DATE <ENTER>
```

<ENTER>

At this point, the command file is in the computer's memory. If you want to keep or run it, you'll have to save it in a disk file. Type:

SAVE MYPROG <ENTER>

and the Editor writes your program, with the name MYPROG, to disk. Now you have a permanent copy.

Exit the Editor by typing QU <ENTER>.

To run your DO-file, type:

DO MYPROG <ENTER>

TRSDOS-16 will clear your screen and display:

TODAY'S DATE IS:

Fri May 14 1982 134 -- 10.24.30

TRSDOS-16 Ready

.....

Sometime in the future, you may want to run MYPROG again, but you've forgotten the exact filename you gave it. You can look at the directory (as we mentioned earlier) to see how it's filed. Type:

DIR <ENTER>

for a directory listing of the disk in Drive 4. TRSDOS-16 returns a DIRectory listing like this:

```

Disk Name:TRSDOS          Drive:4          04/09/82          00.25.52
File Name      Created   Updated      Attrb Fil  Rec   # of  -----Sectors-----

17 Files Displayed

```

You can also use a wildcard to find the filename you want. For example, if the filename does not have an extension, you can avoid a long directory listing that consists of all files with and without extensions by typing:

```
DIR * <ENTER>
```

TRSDOS-16 returns a directory listing that is substantially shorter because it only lists the files without extensions:

```

Disk Name:TRSDOS          Drive:4          04/09/82          00.26.21
File Name      Created   Updated      Attrb Fil  Rec   # of  -----Sectors-----

```

SWAPPING DISKETTES

Whenever you want to change the diskettes in any of your floppy drives, you must perform the DISMOUNT/MOUNT operations. (NEVER change a diskette when a file on that diskette is in use or open.)

To swap diskettes, first remove the diskette(s) you want to change and type:

```
DISMOUNT <ENTER>
```

This informs TRSDOS-16 that you have just removed diskettes from the drives.

TRSDOS-16 returns the prompt:

```
INIT DONE
```

Insert other diskettes, close the drive door, and type:

```
MOUNT <ENTER>
```

Again TRSDOS-16 will acknowledge the change of diskettes with:

```
INIT DONE
```

You can begin using the diskettes.

(See the MOUNT and DISMOUNT commands in the next section for more information.)

SYSTEM COMMANDS

TRSDOS-16 SYSTEM COMMANDS

TRSDOS-16 system commands (typed in at the TRSDOS-16 Ready level) perform a variety of helpful operations:

Diskette Handling commands allow you to prepare your blank diskettes for use or make copies of existing diskettes. Anytime you use a blank diskette, you should use one of these commands:

FORMAT
BACKUP

If you want to change the way your computer system starts up and initializes its parameters, you can use Initialization commands. For example, you can use the FORMS command to set your printer's parameters; or you can use the AUTO command to set your computer to AUTOMATICALLY perform a particular function at start-up. The Initialization commands are:

AUTO MOUNT
DATE SETCOM
DISMOUNT TIME
FORMS

You might find the Auxiliary commands helpful for such functions as seeing what is on your disk, printing some of your disk files, or simply seeing what system commands are available. They include:

CLEAR PAUSE
CLS PRINT
DIR SIZE
DO SPOOL
FREE T
HELP TERMINAL
LIB VERIFY
LIST VERSION

The File Handling commands allow you to copy, rename, or delete your disk files. These commands include:

APPEND MOVE
ATTRIB PROT
COPY PURGE
CREATE RENAME
FCOPY RESTORE

KILL SAVE

Machine Language File Handling commands create and execute machine language disk files. These commands include:

DEBUG EXEC
DUMP LOAD

HOW TO USE THIS SECTION

This section contains an alphabetical listing of each system command, with each listing divided into several parts.

The command syntax is the first line you'll see after the command keyword. Use it as your guide to type in a system command. (See SYNTAX below for a detailed explanation)

Following each syntax is a definition of the system command. This tells you exactly what the specific command does.

Next is additional information on the parameters of the command; i.e., what are the values you must supply, what is optional information, and what these options do when included in the command.

After this optional information, you'll find further explanation of the command, including special instructions on the command, switches, and how best to use the command for your purposes.

Finally, each section gives you examples of the command's use.

SYNTAX

The command's "syntax" tells you what format to use when you type the command.

For example, the syntax for the CLS (Clear Screen) command is simply:

CLS

CLS <ENTER> is all you need to type to execute this command.

The syntax for the KILL command includes an optional parameter (a value you supply):

KILL filespec

In this case, the parameter is a TRSDOS-16 filespec (discussed in Chapter 1). For example, if you want to kill the disk file named SAMPLE in Drive 1, you could type:

```
KILL SAMPLE:1 <ENTER>
```

Still other commands require additional parameters, such as:

COPY source filespec TO destination {option}

Here you must supply the name of the source filespec you wish to copy and the destination where you want it copied. For example:

```
COPY NEW/DAT:1 TO NEWDAT/1:2 <ENTER>
```

makes a copy of the file NEW/DAT, from the diskette in Drive 1, onto the diskette in Drive 2, and then names the new file NEWDAT/1.

Sometimes additional information is required; sometimes it is optional. This optional information is indicated inside braces { }. In the COPY example above, there is one option:

{ABS}

When typing this command, you must decide if you need this option which tells TRSDOS-16 to overwrite any existing files with the same name. If so, type:

```
COPY NEW/DAT:1 TO NEWDAT/1:2 ABS <ENTER>
```

You can usually omit the surrounding braces { } unless you include a comment or if the second filespec is optional and omitted.

Although the variable "comment" is not included in every syntax statement, you can add one at any time. Comments are for your information only. For example:

```
COPY NEW/DAT:1 TO NEWDAT/1:2 {ABS} Latest version
```

documents the purpose of the COPY command.

You might want to use the comment if you are calling the command from a DO-file (see the DO command) or a program.

Every system command uses some variation of the syntaxes discussed above. Pay attention to each command to know the appropriate parameters and options to use.

APPEND

APPEND source filespec TO destination

Copies the contents of the source filespec onto the end of the contents of destination. (The contents of the source file remain the same.)

The destination can be a filespec or a drive number

If it is a drive number alone, TRSDOS-16 will append only if that drive contains a disk file with the same name as the source filespec.

The types of the two files must match, i.e., both must be variable length records (VLRs) or both must be fixed length records (FLRs).

You cannot use the APPEND command with ISAM (indexed access files used by some Compilers such as the COBOL Compiler) files, program files, or TRSDOS-II DO files.

Example

```
APPEND EMPLFILE TO STAFF/LST:3 <ENTER>
```

copies the contents of EMPLFILE onto the end of STAFF/LST on Drive 3.

```
APPEND DOC/NEW:1 TO 2
```

copies the contents of DOC/NEW on Drive 1 to the file of the same name on Drive 2.

ATTRIB

```
ATTRIB filespec {options}
```

Assigns or changes the password and protection level of an existing filespec.

Passwords are initially assigned when the file is created. At that time, the update and access passwords are set at the same value (either the password you specified or a blank password). See TRSDOS-16 FILE SPECS in Section 1 of this manual for further explanation of passwords.

The options are:

ACC=password sets the access password to password. If omitted, the access password remains the same.

UPD=password sets the update password to password. If omitted, The update password remains the same.

PROT=level specifies the protection level for access. If omitted, the level is unchanged. The optional protection levels for access to a file are:

NONE	No access
EXEC	Execute only
READ	Read and execute
WRITE	Read, execute and write
RENAME	Rename, read, execute and write
KILL	Kill, rename, read, execute and write (gives access word total access)

This command allows you to assign a file two passwords. The access password could be for the operator. It protects a file's contents at a certain protection level (set by PROT).

For example, if you want an operator to have limited access to a file, you can set the PROTECTION level to READ. Then, using the access password, the operator will only be able to read and execute the file; not change, rename or kill it.

In the same manner, the update password could be for the programmer. Using the update password, the programmer could change, kill, or rename the same file. (When you use the update password to access a file, TRSDOS-16 ignores the PROTECTION level.)

In short, the access password allows limited access to a file and the update password allows total access.

Examples

```
ATTRIB DATAFILE ACC=JUNE10, UPD=NEWDAT <ENTER>
```

sets the access password to JUNE10 and the update password to NEWDAT. The PROTECTION level remains at the previous setting.

```
ATTRIB PAYFILE ACC= ,PROT=READ <ENTER>
```

sets the access password to blanks, leaves the update password the same, and sets the level of protection to allow only reading and execution of PAYFILE.

AUTO

AUTO command line

Stores command line. This command line will automatically execute whenever you start-up TRSDOS-16. (That is, after you enter the date and time, TRSDOS-16 will load, execute the command line, and then display the TRSDOS-16 Ready prompt.)

command line is optional. If you omit it, TRSDOS-16 deletes the AUTO command line currently stored.

The system doesn't check the command line for errors when you first enter the AUTO command line. Errors are detected when the automatic command is actually executed.

Examples

```
AUTO DIR <ENTER>
```

executes the DIRectory command whenever you start-up. The system then returns to TRSDOS-16 Ready.

```
AUTO <ENTER>
```

Turns off the AUTO function currently stored.

```
AUTO DO MYPROG <ENTER>
```

executes the DO-file named MYPROG.

BACKUP

BACKUP drive1 TO drive2 {options}

(FOR FLOPPY DISKETTE USE ONLY)

Makes an exact copy of the source diskette in floppy drive1 to the destination diskette in floppy drive2.

If the destination diskette is unformatted, the BACKUP command will format it before copying the source diskette to it.

The options are:

- ID=id** assigns the name id to the new diskette.
If omitted, TRSDOS-16 gives the new diskette the same name as the source diskette.
- PW=password** indicates the master password of the source diskette. TRSDOS-16 won't duplicate a diskette unless you give the correct password. (All diskettes distributed by Radio Shack use PASSWORD as the master password.)
- NEW=password** assigns password to the destination diskette. If omitted, TRSDOS-16 uses the password of the source diskette.
- ABS** instructs TRSDOS-16 to overwrite the data on the destination diskette without prompting.

To make a backup copy, you need at least two floppy diskette drives. If you don't have two floppy drives, use the COPY, FCOPY, or MOVE system commands. (See the appropriate command for further information.)

If you have a new Model 16 (not an Enhanced Model II), you can BACKUP a single-sided diskette to a double-sided diskette. This gives you twice as much disk space. You don't need to tell TRSDOS-16 whether the diskettes are single-sided or double-sided.

You cannot BACKUP a double-sided diskette to a single-sided diskette.

If you want to make a copy of a system diskette, BACKUP is

the only way to do this.

Examples

```
BACKUP Ø TO 1 <ENTER>
```

makes an exact copy of the floppy diskette in Drive Ø to the floppy diskette in Drive 1.

```
BACKUP Ø TO 3 {ID=MODEL16 NEW=FEB23} <ENTER>
```

duplicates the diskette in Drive Ø to the diskette in Drive 3, naming the new diskette "MODEL16" and assigning the master password "FEB23" to it.

```
BACKUP 1 TO Ø <ENTER>
```

allows you to copy a data diskette in Drive 1 to a diskette in Drive Ø. After entering this command, TRSDOS-16 will prompt you to insert the destination diskette in Drive Ø.

CLEAR

```
CLEAR
```

Clears user memory.

Example

```
CLEAR <ENTER>
```

CLS

```
CLS
```

Clears the display and positions the cursor at the top left-hand corner of the display.

Example

```
CLS <ENTER>
```

COPY

COPY source filespec TO destination {option}

Copies the source filespec to the destination.

destination can be either a filespec or a drive number. If you use a filespec as the destination, you must also specify the drive number of the disk containing that file. Otherwise, it automatically goes to the primary drive.

If you specify a drive number only as destination, TRSDOS-16 will copy the source file to the disk in that drive, giving the destination file the same name as the source file.

The option is:

ABS tells TRSDOS-16 to overwrite any existing file with the same name without prompting

The source filespec must be a file you can use with TRSDOS-16 or TRSDOS-II. If you cannot, you must FCOPY rather than COPY it. (See FCOPY for details.)

You can make single drive copies of a file. If so, be sure to assign a different filespec for the destination.

Example

```
COPY OLDFILE:3 TO NEWFILE:4 <ENTER>
```

makes a copy of OLDFILE from the diskette in Drive 3 to the diskette in Drive 4, naming the new file NEWFILE.

```
COPY NEW/DAT TO DEFUNCT/DAT:2 ABS <ENTER>
```

copies NEW/DAT to DEFUNCT/DAT (in Drive 2). If you already have a disk file named DEFUNCT/DAT in Drive 2, this command overwrites it with the new file.

```
COPY NEW/DAT TO 2 <ENTER>
```

copies NEW/DAT to the diskette in Drive 2. The newly copied file is also named NEW/DAT.

```
COPY FILE/BAS:4 TO NEW/BAS:1 <ENTER>
```

copies FILE/BAS from the diskette in Drive 4 to the diskette in Drive 1, naming the new file NEW/BAS.

```
COPY INCTAX/IRS:1 TO INCTAX/82:1 <ENTER>
```

copies the file INCTAX/IRS on the diskette in Drive 1 to the same diskette, renaming the file INCTAX/82.

CREATE

```
CREATE filespec {options}
```

Creates a file named filespec and preallocates space for its contents. Without CREATE, TRSDOS-16 allocates space for your file dynamically as you write to it.

The available options are:

NGRANS=n allocates n X 5 sectors to the file.

For example, if you want to allocate 100 sectors to the file, set NGRANS to 20.

NRECS=n assigns n fixed length records to the file. LRL must accompany NRECS.

LRL=n assigns n as the logical record length. n can be 1 to 256. If LRL is omitted, the record length defaults to 256.

TYPE=t specifies the record type as t. t is either F, a fixed length record, or V, a variable length record. If TYPE is omitted, t defaults to F.

NGRANS and NRECS are mutually exclusive. If you use NGRANS, don't use NRECS. If you use NRECS, don't use NGRANS.

When you use CREATE to preallocate a file, TRSDOS-16 does not deallocate unused space at the end of the file. Without CREATE, TRSDOS-16 deallocates the unused space upon closing the file.

Examples

```
CREATE NAMEFILE NGRANS=450,TYPE=F <ENTER>
```

creates a fixed length record file named NAMEFILE with 2250 sectors.

```
CREATE DATMAS/NJ2 NRECS=100,LRL=20 <ENTER>
```

creates a fixed length record file named DATMAS/NJ2 with 100 logical records of 20 bytes each.

```
CREATE MARKET/WST:3 NGRANS=100,TYPE=V <ENTER>
```

creates a variable length record file on Drive 3 named MARKET/WST and allocates 500 sectors to it.

```
CREATE EMPLY/LST NGRANS=200,TYPE=F
```

creates a 1000 sector fixed length record file on the diskette in Drive 0.

DATE

DATE

Displays the date and time in the format:

```
WED MAR 25 1981 84 -- 16.24.34
```

for Wednesday, March 25, 1981, the 84th day of the year, 4:24:34 p.m. Note that leading zeroes are not shown.

Example

```
AUTO DATE <ENTER>
```

automatically displays the date and time upon startup.

DIR

DIR source {options}

Displays the disk's directory.

source can be a standard TRSDOS-16 filespec, a wildcard, or a drive number (0-7). If drive number is omitted, TRSDOS-16 goes to the first available drive.

The options are:

- PRT** prints the directory listing on the line printer.
- SYS** displays only the system files (certain Radio Shack files). If you don't use the SYS option, TRSDOS-16 displays only the user files.

17 Files Displayed									
⑩				⑥	⑦	⑧	⑨	⑩	

What the column headings mean:

- 1 Disk Name -- The name assigned to the disk when it was formatted or backed-up.
- 2 File Name -- The name and extension assigned to a file when it was created. (Insert A)
- 3 Creation Date -- When the file was created.
- 4 Update -- When the file was last modified.
- 5 Attributes -- A four-character field.

The first character is either P for Program file or D for Data file.

The second character is either S for System file or * for User file.

The third character gives the password protection status.

X The file is unprotected (no passwords)

A The file has an access word but no update word.

U The file has an update word but no access word.

B The file has both update and access words.

The fourth character specifies the level of access assigned to the access word:

0,1 Kill file and everything listed below.

2 Rename file and everything listed below.

3 Not used.

4 Write and everything listed below.

5 Read and everything listed below.

6 Execute only.

7 None.

The ATTRIB command explains how to change the access password, update password, and protection level.

- 6 File Type -- Indicates the record type for the file.

F Fixed-length records.

V Variable-length records.

- 7 Record Length -- Assigned when the file was created (applies to fixed-length record files only.)

- 8 Number of Records -- How many logical records have been written. Plus signs (+) signify none have been written or file has variable length records and number written cannot be calculated. True number of records can be inferred from Sectors Used column.

- 9 Sectors Allocated -- How many sectors (256 byte blocks) have been allocated to the file.
- 10 Sectors Used -- Shows how many sectors have data written into them. Plus sign (+) means no data in file.
- 11 Files Displayed -- the number of files on the DIRectory listing.

Figure 1. Sample DIRectory Display

Examples

```
DIR BAST/ASM <ENTER>
```

lists the directory for the file BAST/ASM on the display.

```
DIR 3 PRT <ENTER>
```

lists the directory of the diskette in Drive 3 to the line printer.

```
DIR B*/* <ENTER>
```

displays all files in the directory beginning with the letter B and having an extension.

DISMOUNT

DISMOUNT

Tells TRSDOS-16 that you have removed diskettes in the floppy drives.

The DISMOUNT command informs TRSDOS-16 that you have just taken diskettes out of the drives. Once you enter the DISMOUNT command and TRSDOS-16 acknowledges, you can insert different diskettes. See MOUNT for details.

Example

```
DISMOUNT <ENTER>
```

informs TRSDOS-16 that you have removed diskettes from the floppy drives. TRSDOS-16 acknowledges the DISMOUNT by displaying:

```
INIT DONE
```

Now you can insert other diskettes

DO

DO filespec

Executes a "DO-file" -- a file containing one or more system commands or programs.

You can create this DO-file with the Editor. The example below shows how.

A DO-file cannot include the SPOOL command. You can load and execute programs from a DO-file and chain DO-files together.

Example

This example creates a sample DO-file that prints the current date and amount of free sectors on the disk in the primary drive whenever you execute it.

You need to use the Editor to create this file. Type:

```
EDIT16 <ENTER>
```

to get into the Editor. The C? prompt is displayed, signifying the Editor's command level.

To begin writing your program, type:

```
IN <ENTER>
```

This puts you in the insert mode, with the prompt I?. You can begin entering command lines. Type:

```
DATE <ENTER>
```

FREE <ENTER>

These are your command lines. Now save this DO-file under the name HELLO. But first, exit the insert mode. Type:

! <ENTER>

and then, to save the file, type:

SA HELLO <ENTER>

Exit the Editor by typing:

QU <ENTER>

and you can run your DO-file, listed on your directory as HELLO. Type:

DO HELLO <ENTER>

and TRSDOS-16 executes the DO-file named HELLO and prints the date and free list on your display (see the DATE and FREE commands).

DRIVE

DRIVE drive {options}

Allows you to:

1. Gain optimum use of a floppy disk drive by changing the following disk drive settings:
 - . seek rate (the rate the computer is able to access the diskette)
 - . diskette swap detection
 - . wait (for a drive ready condition)
2. Turn secondary floppy or hard disk drives offline.

If you include no options, DRIVE returns the current settings for the specified drive.

The following information offers a thorough explanation of the DRIVE command and all its options. Please read it before using this command.

The options are:

RATE=n (used for floppy drives only.) Sets the seek rate of the floppy disk drive. n may be:
Ø = 3 milliseconds
1 = 6 milliseconds
2 = 1Ø milliseconds
3 = 15 milliseconds
If omitted, setting is not changed.

DETECT (used for floppy drives only.) Sets the diskette swap detection. This causes TRSDOS-16 to check the drive hardware for a "door opened" condition. Set DETECT for Push-Button and Thinline drives.

NODETECT (used for floppy drives only.) Sets the diskette swap to "no detection". This causes TRSDOS-16 to ignore any "door opened" conditions received from the drive hardware. Set the latch drives for NODETECT.

WAIT (used for floppy drives only.) Sets TRSDOS-16 to wait for the drive to gain proper motor speed if a "Drive Not Ready" error occurs, then try again. If the error occurs again, then the drive is considered not ready and an error code is generated. Set WAIT for Thinline drives.

NOWAIT (used for floppy drives only.) Sets TRSDOS-16 to not wait if a "Drive Not Ready" error occurs. Generate error code immediately. Set Push-Button and Latch Drives to NOWAIT.

OFFLINE (all secondary drives) Sets a drive offline. TRSDOS-16 ignores that drive entirely.

ONLINE (all secondary drives) Sets a drive online.

1. GAINING OPTIMUM USE OF FLOPPY DISK DRIVES

When TRSDOS-16 starts up, it initializes each of your floppy drives to the following seek, swap, and wait/nowait settings:

DRIVE	SEEK RATE	SWAP DETECT	WAIT/NOWAIT STATUS
Ø	1Ø ms	DETECT	WAIT
1 - 3	15 ms	NODETECT	WAIT

Any type of Model 16/Model II floppy drive can operate under these settings. However, to get the optimum use out of your particular drive, we suggest you try different settings.

There are three types of drives that could be on your Model 16 or Enhanced Model II computer. Each type of drive has its own set of specifications that determines how it can be set-up.

The three types of drives are:

- Push-Button used as Drive Ø in most Model II's and as the secondary drives in some Model II Expansion Bays
- Latch used as the secondary drives in some Model II Expansion Bays
- Thinline used in the Model 16

We suggest you try the following settings for each of these drives.

Drive	Minimum Rate	Swap Detect	Wait / Nowait
Push-Button	1Ø ms	DETECT	NOWAIT
Latch	15 ms*	NODETECT*	NOWAIT
Thinline	3 ms	DETECT	WAIT*

* These settings are required for these particular drives and are set this way at start-up.

You can determine the type of drive you have by looking at the pictures below.

Push-Button

Latch

Thinline

Figure 2. The three types of drives

When using the DRIVE command with the seek rate, swap detect, and wait options, be sure to note the following:

When reset, TRSDOS-16 always returns to the start-up settings. Use the AUTO command (or a DO file) to implement the DRIVE command automatically upon power-up or reset.

If you receive numerous I/O errors on disk reads/writes after changing the seek rate, you probably set it too fast for that particular drive. To remedy this, either issue the DRIVE command again with the proper seek rate or reset the computer.

Latch drives cannot properly detect if a drive door has been opened since the last disk access. Always set Latch drives with the NODETECT option.

- . Thinline drives have a built in feature to reduce the wear on the floppy diskette. If a Thinline drive is not accessed for 20 seconds or more, the drive motor shuts off until the next drive access. At the next disk access, it takes approximately 8/10 of a second for the motor to reach proper speed.
- . Always set Thinline Drives with the WAIT option. If a Thinline Drive is run with the NOWAIT option, a "Drive Not Ready" error will occur since the motor could not reach proper speed before the access.

Examples

If your Drive 0 is a Thinline drive, this command:

```
DRIVE 0 {RATE=0,DETECT,WAIT} <ENTER>
```

allows you to get the optimum use out of Drive 0.

If your drive is Push-Button, this command:

```
DRIVE 1 {RATE=2,DETECT,NOWAIT} <ENTER>
```

allows you to get the optimum use out of Drive 1.

If your drive is a Latch, this command:

```
DRIVE 1 {RATE=3,NODETECT,NOWAIT} <ENTER>
```

allows you to get the optimum use out of Drive 1.

2. TURNING THE DRIVES OFFLINE

The OFFLINE option turns a secondary disk drive OFFLINE; ONLINE turns it back ONLINE. You can use both options with both hard or floppy secondary disk drives:

Floppy Drives -- By turning a non-existing or unused secondary floppy drive OFFLINE, TRSDOS-16 will access your disks much more quickly.
Hard Disk Drives -- If you have more than one hard disk drive, you can MOVE or COPY files to your secondary drive(s), turn these drives OFFLINE, and thus protect your files from access and/or change.

The default is ONLINE. When you turn a drive back ONLINE after it was OFFLINE, you must also use the MOUNT command to reinitialize the drive.

Examples

```
DRIVE 5 {OFFLINE} <ENTER>
```

allows you to protect files on Drive 5 from access.

```
DRIVE 3 {OFFLINE} <ENTER>
```

allows you to tell TRSDOS-16 not to attempt to access Drive 3; this speeds up access time.

```
DRIVE 2 {ONLINE} <ENTER>
```

tells TRSDOS-16 to attempt to access Drive 2.

If you have a Hard Disk, you might find it helpful to create a DO-file (see DO command) containing these commands:

```
DRIVE 6 {ONLINE}  
MOVE !:5 TO 6 {ABS}  
DRIVE 6 {OFFLINE}
```

This will cause TRSDOS-16 to turn Drive 6 ONLINE, MOVE all the files on Drive 5 to Drive 6 and then turn Drive 6 back OFFLINE.

DUMP

DUMP filespec {options}

Copies filespec, a machine-language program, from memory to disk. You can then load and execute the program at any time.

The options can be any or all of the following:

START=address sets address as the program's starting address.

END=address sets address as the program's ending address.

TRA=address sets address as the transfer address.
This is the address where your program begins executing after you load it. If omitted, DUMP uses the address set by RELO. The transfer address must be less than the ending address.

RELO=address sets address as the starting address for loading the program back into memory. If omitted, **START** is used.

RORT=c specifies the program as c, directly executable from TRSDOS-16 Ready mode. c can be:
R(eturn) loads filespec, but doesn't execute it.
T(ransfer) loads and executes filespec from TRSDOS-16 Ready. If omitted, **RORT=T** is used.

NOTE: All addresses are 24-bit hexadecimal numbers (up to six digits).

Examples

```
DUMP TEST/FIL START=64F0, END=6AF0, TRA=67F2, RORT=R <ENTER>
```

creates filespec TEST/FIL which contains the program in memory location 64F0 hex to 6AF0 hex. When loaded, it occupies the same memory location. Since this specifies RORT=R, you can't execute the program from TRSDOS-16 Ready mode.

```
DUMP INTCOM/DMA START=6000, END=67FF, TRA=3108, RELO=3000 <ENTER>
```

creates filespec INTCOM/DMA. It contains the program in memory location 6000 hex to 67FF hex. When loaded, the program resides from 3000 to 37FF and execution starts at 3108 hex. You can execute program from the TRSDOS-16 Ready mode by typing:

```
INTCOM/DMA <ENTER>
```

EXEC

EXEC filespec

Executes filespec.

The keyword EXEC is optional.

Examples

```
EXEC JOBLIST <ENTER>
```

executes JOBLIST.

```
NAMEDUMP <ENTER>
```

executes the program NAMEDUMP.

FCOPY

FCOPY source TO destination {options}

Copies disk files that were created with the Model II TRSDOS Operating System to a disk formatted by TRSDOS-16 (or TRSDOS-II) and vice versa.

You must FCOPY any disk files created with Model II TRSDOS before you can use them with TRSDOS-16 or TRSDOS-II. You will get the error -- Illegal I/O Attempt -- if you attempt to use a Model II diskette while operating under TRSDOS-16.

source can be a filespec, wildcard, or drive that you want to copy.

destination can be the drive number that you are FCOPYing to or the filespec you are FCOPYing to. destination can be a filespec only if source is a filespec.

options can be one of the following:

- ABS** tells TRSDOS-16 to overwrite any data that already exists on the disk
- PROMPT** tells TRSDOS-16 to prompt you before it copies a file. You should press <Y> yes, <N> no, <Q> quit, or <S> stop asking for prompting.
- ALL** tells TRSDOS-16 to copy all files. (ALL won't transfer system files, use SYS.) If you use

drive as source, you must use ALL.

SYS allows you to FCOPY language and application programs. If used, destination must be primary drive.

In addition to using FCOPY to copy disk files and change their format, you can use FCOPY to get a DIRECTORY listing of your Model II TRSDOS files while you are in the control of TRSDOS-16.

The syntax is:

```
FCOPY drive {DIR,SYS,PRT
```

When you use the FCOPY command with DIR and SYS, TRSDOS-16 will return the DIRECTORY according to the way the diskette in drive is formatted. For example, if you enter the command:

```
FCOPY 1 {DIR,SYS} <ENTER>
```

and the diskette in Drive 1 is in TRSDOS 2.0A format, it will return a directory consisting of both System and User files.

On the other hand, if you use the same command on a diskette formatted under TRSDOS-II, it will return a DIRECTORY of only the System files.

Examples

```
FCOPY NEWFILE/TXT TO :3 <ENTER>
```

copies NEWFILE/TXT (contained on a Model II TRSDOS formatted diskette) to the diskette in Drive 3 (a TRSDOS-16 formatted diskette).

```
FCOPY 1 TO Ø {ALL} <ENTER>
```

copies all files on the TRSDOS-formatted diskette in Drive 1 to the TRSDOS-16 formatted diskette in Drive Ø.

```
FCOPY ! TO 1 <ENTER>
```

copies all files, with and without extensions, from the disk in the primary drive to Drive 1. (See "Wildcards" in Section 2.)

```
FCOPY TRN/TXT:1 TO TRN.TXT/OLD:4 <ENTER>
```

copies the file TRN/TXT on the diskette in Drive 1 to the disk in Drive 4, renaming the file TRN.TXT/OLD as it copies and reformats.

```
FCOPY 2 {DIR} <ENTER>
```

lists the DIRectory of the Model II TRSDOS diskette in Drive 2.

FILES

FILES source {options}

Returns an alphabetical listing of the filenames that are stored on the specified source.

source can be a standard TRSDOS-16 filespec, a wildcard, or a drive number (Ø-7). If drive number is omitted, TRSDOS-16 goes to the primary drive.

The options are:

SYS lists all system files. SYS is optional; if omitted, TRSDOS-16 lists only the user files.
PRT tells TRSDOS-16 to print the files. PRT is optional; if omitted, lists files on the video display.

This command will list filenames that are stored on the specified drive. This is not the same as DIRectory because only filenames are listed with FILES. FILES lists the filenames alphabetically in five columns (from left to right) across the screen.

FILES allows full wildcarding. For details, see Section I of this manual.

Example

```
FILES */BAS:4 {PRT} <ENTER>
```

lists all files with the extension /BAS on Drive 4 to the printer.

```
FILES 0 {SYS} <ENTER>
```

lists all System files on Drive 0. The System directory is on Drive 0.

FLOPPY

FLOPPY (options)

Tells TRSDOS-16 to ignore all references to floppy drive numbers within filespecs. This is useful when a program includes a reference to a file specification where a drive number is included.

options are:

ON sets FLOPPY ON. TRSDOS-16 does not ignore references to drive number within filespecs

OFF sets FLOPPY OFF. TRSDOS-16 ignores any references to drive number within filespecs

If you do not specify option, TRSDOS-16 displays the current status of FLOPPY.

When you enter FLOPPY OFF, TRSDOS-16 ignores any reference to a floppy drive number (0-3) within a system command or program and follows the normal file search sequence (going to the primary drive first).

For example, assume a COBOL program references a file named SAMPLE:2. By turning FLOPPY OFF, TRSDOS-16 will treat this reference as simply SAMPLE (ignoring the drive reference) and look for it on the primary drive first.

The system commands which require a filespec and are affected by FLOPPY are:

ATTRIB	DO	LOAD
APPEND	DUMP	MOVE
COPY	KILL	OPEN
CREATE	LIST	RENAME

Examples

```
FLOPPY {OFF} <ENTER>
```

sets FLOPPY OFF so that TRSDOS-16 ignores any references to drive numbers within a filespec entered with a system command or program.

```
FLOPPY {ON} <ENTER>
```

turns FLOPPY ON so that TRSDOS-16 uses the drive number referenced in any filespec.

```
FLOPPY <ENTER>
```

returns the status of FLOPPY.

FORMAT

FORMAT drive (options)

Prepares a blank disk for use by defining the tracks and sectors, and writing system information onto it. (For more information, see TECHNICAL INFORMATION.)

drive specifies the drive to use for the format operation and can be Drives 0 - 3 and 5 - 7. If omitted, TRSDOS-16 prompts you to enter the drive number.

The options are:

- ABS** tells TRSDOS-16 to overwrite existing data without prompting. If omitted, TRSDOS-16 warns you before overwriting a disk that contains data.
- ID=id** assigns a name to the disk being formatted. If omitted, TRSDOS is used.
- PW=pw** assigns the master password to the disk. If omitted, PASSWORD is used. The master password allows access to all user files (via the PROT command), and also allows full BACKUP privileges.
- DIR=nn** places the primary directory on cylinder nn. If omitted, TRSDOS-16 uses cylinder 44, (single-sided and double-sided floppy); or

cylinder 130 (hard disk). You can put the primary directory on any cylinder from 1 - 71 (single-sided or double-sided floppy); or 1 - 253 (hard disk).

ALT=nn places the alternate directory on cylinder **nn**, which is a backup of the primary directory. If **ALT=00**, no alternate directory is created. If you omit the **ALT** option, it will be at the location of the primary directory plus 3 cylinders (single-sided and double-sided floppy, or hard disk). You can put the alternate directory on cylinders 1 - 71 (single- or double-sided floppy); or 1 - 253 (hard disk).

SIZ=nn tells TRSDOS-16 to allow **nn** filenames in the initial directory. For hard disks and floppy diskettes, **nn** can be any number between 1-1220. If omitted, the default is 180 (single- or double-sided floppy); or 336 (hard disks).

FULL/NONE is the verification level. **FULL** instructs TRSDOS-16 to read each sector and compare the value against what was written during initialization. **NONE** instructs TRSDOS-16 not to perform verification.

The disk you format can be blank or already formatted. If it is already formatted, all information is lost when you reformat the disk.

Examples

```
FORMAT 1 {ID=ACCOUNTS,PW=IRS} <ENTER>
```

formats the diskette in Drive 1 and names the diskette **ACCOUNTS** with the password **IRS**.

```
FORMAT <ENTER>
```

prompts you for the drive to use before it begins to format. Since no options are used, the diskette will have the name **TRSDOS**, the password **PASSWORD** and all the other option defaults.

```
FORMAT 2 {DIR=01,ALT=05,SIZ=360} <ENTER>
```

formats the diskette in Drive 2, puts the primary directory on cylinder 1, the alternate directory on cylinder 2 and sets the number of directory records to 360.

WHEN TO FORMAT

To prepare a new disk

Before you can use a new diskette, you must format it (unless you use the BACKUP command with a floppy diskette). After formatting, record the disk name, date of creation and password in a safe place. This helps you estimate how long a disk has been in use, and prevents your forgetting the master password. (For this application, always use the FULL verify option.)

To erase all data from a disk

To "start over" with a disk, you can format it. This erases all old information on the disk and puts the system information back on it.

To lock out flawed areas

After prolonged use, flaws may develop on a diskette. If you reformat the disk, it locks out these flawed sectors while leaving the good sectors available for data storage. Use the FULL verify option for this application.

FORMS

FORMS {format options}

FORMS {switch options}

Sets up the printer parameters.

The {format options} are:

P=n sets n as number of lines per page. n can be any number between 0 and 255. If omitted, it is 66.

L=n sets n as the maximum number of lines to print on a page before issuing an automatic top of form. n can be 0 to 255 and, if omitted, L=60. The number of lines must be less than or equal to the page length. If either page length or lines

is \emptyset , both must be \emptyset . If $L=\emptyset$, TRSDOS-16 doesn't issue an automatic top of form.

W=n sets n as the maximum number of characters to print on a line before issuing an automatic carriage return. n can be any number between \emptyset and 255. If omitted, $W=132$.

If $W=\emptyset$, TRSDOS-16 doesn't issue any automatic carriage returns.

C=h sets the output to h, a one-byte control code in hexadecimal, to the printer. It is sent on completion of FORMS command.

The default parameters are $P=66$, $L=6\emptyset$, $W=132$ and $C=\emptyset$. If you want to use the default parameters, you don't need to issue the FORMS command.

To determine the parameters to set for:

page size	multiply form length in inches by the number of lines per inch.
lines per page	determines the number of blank lines at the bottom of every page. If page length equals lines, then every line on the page is printed. lines can't be greater than page length. width sets the maximum number of printable characters per line. If a line is greater than width, then TRSDOS-16 automatically breaks the line at the maximum length and continues printing at the next print line.
control codes	are required on some printers, e.g. to set up for double space character, etc. The TRSDOS-16 sends the specified code to the printer or print file during execution of the FORMS command.

The {switch options} are:

X	sends all data to printer or printer file without any translation (transparent mode).
D	ignores all printer output ("dummy" mode).
N	returns to normal (nontransparent, non-dummy) mode. This is the default mode.
A	outputs line feed after carriage return (auto line feed mode) even if transparent mode is in effect. Updates count by carriage returns, not by line feeds.

T sends top of form character to printer.
Q cancels auto line feed mode.
S switches to serial Channel B printer driver. (You must do SETCOM before any printing can be done.)
R returns to parallel printer driver.

See the PRCTRL Supervisor Call in the Technical Information Section for information on transparent, dummy modes, etc.

Examples

FORMS <ENTER>

resets all FORMS parameters to the default values.

FORMS P=51, L=46, W=92 <ENTER>

sets page length to 51, printed lines per page to 46 and characters per line to 92.

FORMS D <ENTER>

invokes the dummy mode. This means TRSDOS-16 will ignore all printer commands.

FREE

FREE drive {option}

Returns a list of the disk's free sectors.

drive is optional; if omitted, it defaults to the primary drive.

The option is:

PRT prints the listing on the Printer. If omitted, TRSDOS-16 automatically displays it on the video display.

This information is useful to optimize file access time. If you use a disk extensively (files updated, killed, extended, etc.), the files often become fragmented. This means that the file may be put in different parts of the

disk's memory -- extents. When this happens, the access time is considerably increased because the disk read/write mechanism must move back and forth across the disk to read or write to a file.

FREE helps you determine the extent that your disk files are fragmented. Once you determine this and you decide that you'd like to re-organize a particular file to allow faster access, you can COPY or MOVE it to a "clean" diskette.

```

      ①                               ②
FREE LIST for Drive:4      Disk Name:TRSDOS
6      33      16587      34      16592——③
33252 Free Sectors in 5 Extents
  |                               |
  ④                               ⑤

```

- 1 Drive Number
- 2 Disk Name
- 3 Number of FREE sectors in each extent
- 4 Total number of free sectors
- 5 Number of FREE extents (an extent is an area on the disk)

Figure 3. FREE List

Example

```
FREE <ENTER>
```

displays the amount of free space on the disk in the primary drive.

```
FREE {PRT} <ENTER>
```

lists the amount of free space for the primary drive to the printer. Because no drive specification is included in this example, you must use the braces, ()

```
FREE 2 PRT <ENTER>
```

lists the free space for Drive 2 to the printer.

HELP

HELP command

Displays the syntax of a TRSDOS-16 command. command is optional; if you omit it or type an unrecognized command, TRSDOS-16 displays the TRSDOS-II and TRSDOS-16 commands and general subjects for which HELP is available.

Example

```
HELP MOVE <ENTER>
```

displays the syntax for the MOVE command.

```
HELP SYNTAX <ENTER>
```

returns an explanation of the format of the HELP messages.

KILL

KILL filespec

Deletes filespec from the directory and frees the space allocated to it.

Before it deletes the file, TRSDOS-16 displays the complete filespec and prompts you with the options "Delete? (Y/N/Q)..", i.e., Yes, No, or Quit.

Example

```
KILL DATAFILE/OLD <ENTER>
```

deletes DATAFILE/OLD from the directory and frees all space allocated to it.

LIB**LIB**

Displays a listing of all system commands.

Example

```
LIB <ENTER>
```

LIST**LIST filespec (options)**

Lists the contents of filespec. This listing shows the hexadecimal contents and the ASCII characters corresponding to each value. For values outside the range of hexadecimal 20 to 7F, TRSDOS-16 displays a period.

The options are:

- PRT** lists filespec to the printer. If omitted, the listing automatically goes to the screen.
- SLOW** tells TRSDOS-16 to pause after each record. If omitted, the listing is continuous.
- R=n** sets the starting record to n. The range for n is 1 to 65,535. If omitted, 1 is used. (See TECHNICAL INFORMATION for details.)
- A** tells TRSDOS-16 to list only the ASCII characters.

Examples

LIST DATA/BAS <ENTER>

lists the contents of DATA/BAS.

LIST TEXTFILE/1 SLOW <ENTER>

lists the contents of TEXTFILE/1, pausing after each record.

LIST TEXTFILE/1 R=1000, A <ENTER>

lists TEXTFILE/1 starting with the 1000th record in it. Only ASCII characters are displayed.

LIST PROGRAM/CMD PRT <ENTER>

lists PROGRAM/CMD to the printer.

LOAD

LOAD filespec

Loads a machine language program named filespec and then returns to the TRSDOS-16 mode.

Example

LOAD MARKET/OBJ <ENTER>

loads the machine language program file named MARKET/OBJ into memory.

MOUNT

MOUNT

Tells TRSDOS-16 that you have inserted different diskettes in the floppy disk drives.

Whenever you swap diskettes, you must tell TRSDOS-16 that you have done so -- both before removing the old diskettes and after inserting the new diskettes. (Be sure not to remove a diskette when a file is open.)

See the DISMOUNT system command for instructions on removing diskettes.

Example

```
MOUNT <ENTER>
```

informs TRSDOS-16 that you have inserted different diskettes in the floppy drives.

TRSDOS-16 will acknowledge the MOUNT by displaying:

```
INIT DONE
```

MOVE

```
MOVE source TO destination {options}
```

Copies single or multiple user files to the destination disk.

source can be a filespec, a wildcard (* or !), or simply a drive number. However, you cannot move password protected files.

When you specify only drive as the source, TRSDOS-16 moves all user files on the disk in that drive to the destination drive.

destination is the drive number of the disk where you want your file(s) moved. Your MOVED files will retain the same name as the source filespec.

options are:

ABS instructs TRSDOS-16 to overwrite any existing files on the destination disk that have the same name.

PROMPT tells TRSDOS-16 to display each file before moving it and to give you a set of options for

that file. The PROMPT options are: Y/N/S/Q (Yes--Copy;No--Don't Copy;Stop prompts and proceed with all copies;Quit this command--no more copies.) If PROMPT is omitted, TRSDOS-16 moves all files that match the wildcard specification.

ALL tells TRSDOS-16 to move all user files. This parameter is required when you move all files (except the system files) on a disk.

MOVE is useful when you want to copy all of your TRSDOS-16 files from floppy diskette to hard disk, or vice versa. Because it moves only the user files (those files which you create), you need to use the COPY command to move your system files (your Radio Shack files, such as the Editor, or the Assembler).

For example, type:

```
MOVE Ø TO 4 {ALL} <ENTER>
```

to move all your user files from the diskette in Drive Ø to hard disk.

Then, use the COPY command to copy each of your system files to your hard disk.

Examples

```
MOVE DAT/FLE:1 TO 3 <ENTER>
```

moves the file DAT/FLE on the diskette in Drive 1 to the diskette in Drive 3, keeping the filename DAT/FLE.

```
MOVE */PAY TO 2 <ENTER>
```

copies all user files with the extension /PAY on the disk in the primary drive to the diskette in Drive 2

```
MOVE ! TO 3 <ENTER>
```

moves all user files, with and without extensions, on the primary drive to the diskette in Drive 3.

MSG

MSG "message"

Prints message on the screen. You must enclose the message in quotes.

This command is especially useful in a DO-file. (See DO for more information.)

Example

```
MSG "THIS PROGRAM REQUIRES ONE DATA DISKETTE" <ENTER>
```

prints THIS PROGRAM REQUIRES ONE DATA DISKETTE on the screen.

PATCH**PATCH filespec {options}**

Allows you to make minor corrections in any disk file, provided that:

1. You know the existing contents and location of the data you want to change.
2. You want to replace one string of code or data with another string of the same length.
3. The file is a fixed-length record (FLR) file.

filespec indicates the file you want to change. If it is a system file, no password is necessary. If it is a protected user file, you must include the password

The options are:

A=aaaa indicates the starting address of the data to be changed. This is where the data resides in memory when the program is loaded. aaaa is a four-digit hexadecimal value without the X' notation. (The A option will not work on 68000 programs. Use the R and B options instead.)

F=findstring indicates the string that is currently in the patch area.

C=changestring indicates what data will replace findstring. changestring must contain the same number of bytes as findstring

R=record tells which record contains the data to be changed, and is a decimal number from 1 to 65536.

B=starting byte specifies the position of the first byte to be changed. It is a decimal number from 1 to 256.

You can use PATCH to make minor changes to your own machine-language programs; you won't have to change the source code, reassemble it, and recreate the file. You can also use it to make minor replacement changes in data files.

PATCH also allows you to implement any modification to TRSDOS-16 that may be supplied by Radio Shack. This way, you do not have to wait for a later release of the operating system.

NOTE: If you press <BREAK> during a PATCH operation, before any changes have been made in the file, PATCH will close the file and return to TRSDOS-16. The file will be unchanged. Once the PATCH process begins, <BREAK> will have no effect.

USING PATCH ON A TRSDOS-16 SYSTEM FILE

When Radio Shack releases a modification to TRSDOS-16, you will receive a printout of the exact PATCH commands that you must enter to perform the change.

To implement such a change, follow these steps:

1. Make a backup copy of the diskette to be patched.
2. Insert the TRSDOS-16 diskette to be changed into one of the drives. (Make sure the diskette is "non-write-protected.")
3. In the TRSDOS-16 Ready mode, type in the specified PATCH command.
4. After the PATCH is complete, test the diskette in Drive \emptyset to see that it is operating as a TRSDOS-16 system diskette. You will have to reset the Computer.

USING PATCH ON A Z-80 PROGRAM FILE

In this context, "program files" refers strictly to those files stored with the "P" attribute. Use the DIR command to find out the attributes of a file. BASIC programs have the "D", not the "P", attribute. (See instructions for changing data files.) Program files are created with DUMP.

If you want to change four bytes in a machine-language program file, you must first determine where the four-byte sequence resides in RAM when the program is loaded. Next make sure that your replacement string is the same length as that of the original string. For example, you might write down the information as follows:

```
Files to be changed: VDREAD
Start address: H'5280'
Sequence of code to be changed: H'CD2C25E5'
Replacement code: H'000000C9'
```

Then you could use the following command:

```
PATCH VDREAD A=5280,F=CD2C25E5,C=000000C9
```

USING PATCH ON 68000 PROGRAM FILES AND DATA FILES (INCLUDING BASIC AND COBOL PROGRAMS)

If you want to patch a 68000 program file or if you have a file stored with the "D" attribute, you must specify the patch area in terms of the logical record which contains the data, and the starting byte of the data record. (The TRSDOS-16 LIST command gives this information.)

For example, if you want to change a 12-byte sequence in a file called NAMEFILE, use the LIST command to find the location of the sequence. If it is in Record 128, starting at byte 14, write down the information like this:

```
File to be change: NAMEFILE
Record number: 128
Starting byte: 14
Sequence of text to be changed: "JOHN'S DINER"
Replacement text: "JACK'S PLACE"
```

Then use the following command to patch a data file:

```
PATCH NAMEFILE R=128,B=14,F="JOHN'S DINER",C="JACK'S PLACE"
```

For data files, notice that either string can include a single-quote, as long as the string is surrounded by double-quotes. If you want to include a double-quote inside either string, you would have to enclose that string in single-quotes.

Use this command to patch a 68000 program file:

```
PATCH BUDGET/PRO R=24,B=8,F=FDCB00,C=C38120
```

NOTE: The string you change must be entirely contained inside the specified record. If it spans two records, you will have to perform the patch operation twice, once for each record.

ERROR CONDITIONS

If a TRSDOS-16 error occurs during the patch operation, you will receive the appropriate error message, and the patch will be terminated without changing the file.

PATCH can also produce the following messages

PATCH STRING TOO LONG -- ABORT This occurs when you patch a data file and the patch string spans two records. You need to perform the patch in two steps, one for each record that contains a part of the string to be changed.

FILE CONTAINS VARIABLE-LENGTH RECORDS -- ABORT You can only patch fixed length record files.

STRING NOT FOUND The findstring was not found at the patch location you specified. Before patching a file, you must know the exact patch location and the existing contents of that location

ADDRESS OUT OF PROGRAM-LOAD RANGE -- ABORT This occurs when you attempt to patch a program file and some or all of the patch string is outside the RAM area where the program resides when it is loaded. Check the A=aaaa parameter. Also be sure that the findstring and changestring are not longer than you intend them to be.

PAUSE**PAUSE prompt message**

Prints prompt message and then waits for the operator to press <ENTER>. (The prompt message is optional.)

Like MSG, this command is especially useful in a DO-file. (See DO for more information.)

Example

```
PAUSE INSERT DISKETTE "SALESRPT" INTO DRIVE 2 <ENTER>
```

prints PAUSE INSERT DISKETTE "SALESRPT" INTO DRIVE 2, Press any key to continue, then pauses until the operator presses a key.

PRINT**PRINT filespec {options}**

Prints out contents of filespec, omitting the record numbers and hexadecimal codes (LIST does that). filespec must be a text file.

The options are:

- A** causes TRSDOS-16 to treat the first byte in each record as a FORMS control character. The meaning of the character in the first byte is:
 - "l" do a form feed before printing (top of form).
 - "b" do a carriage return before printing (single space)
 - "Ø" perform two carriage returns before printing (double space).
 - "+" perform a carriage return without a line feed advance. If current printer can do a carriage return without a line feed, this control code causes the characters following to be over printed on the current line.

V causes TRSDOS-16 to output the filespec to the video display, as well as to the printer.

NOTE: Use the A option only when filespec contains the control codes listed.

Example

```
PRINT PROGRAM/TXT V <ENTER>
```

outputs PROGRAM/TXT to the video display, as well as to the printer.

PROT

PROT drive {options}

Changes password protection of the disk in the drive on a large scale.

The options can be any of the following:

- OLD=password** specifies the disk's current master password. You cannot use any of the remaining options without specifying this.
- NEW=password** assigns the TRSDOS-16 disk the new master password.
- LOCK** tells TRSDOS-16 to assign all user files the latest master password. Both update and access words are then set to this password. (See ATTRIB for information on access and update passwords.)
- UNLOCK** tells TRSDOS-16 to remove passwords from all user files.

A disk's master password is initially assigned during the format or backup process. The Model 16 systems disk is supplied with the master password PASSWORD.

Example

```
PROT 1 OLD=PASSWORD, NEW=H2Ø <ENTER>
```

changes the master password of the diskette in Drive 1 from PASSWORD to H20.

```
PROT Ø OLD=H20, UNLOCK <ENTER>
```

removes passwords from every user file on the diskette in Drive Ø.

```
PROT Ø OLD=H20, NEW=ELEPHANT, LOCK <ENTER>
```

changes the master password from H20 to ELEPHANT and assigns the new password to every user file.

PURGE

PURGE drive {options}

Quickly deletes files from the disk in the specified drive number.

drive is optional. If omitted, the primary drive is used.

The options are:

SYS	System files (program and data)
PROG	User machine-language program files.
DATA	User data files.
ALL	All files, user and system.

If the options are omitted, TRSDOS-16 only allows you to PURGE data files.

Once you enter the PURGE command, TRSDOS-16 prompts you for the disk's password. Type in up to eight characters and press <ENTER>. (All disks distributed by Radio Shack use the password PASSWORD.)

The system then displays the file names, one at a time, prompting you to kill one file at a time, keep the file, or quit the operation.

Example

```
PURGE 1 <ENTER>
```

allows you to delete data files from Drive 1

```
PURGE 2 {PROG} <ENTER>
```

allows you to delete user machine-language program files from the diskette in Drive 2.

RENAME

```
RENAME filespec1 TO filespec2
```

Renames filespec1 to filespec2.

RENAME alters only the filename and extension, not the contents or the physical position of the file on the disk. The file's password also remains the same. (See ATTRIB to change the password.)

Example

```
RENAME DATA/FLE TO DATFILØ1 <ENTER>
```

renames DATA/FLE to DATFILØ1

RESET

```
RESET
```

Resets/restarts TRSDOS-16.

This command is almost the same as using the RESET switch. The RESET command closes all open files if you are at the TRSDOS-16 Ready prompt.

Example

```
RESET <ENTER>
```

RESTORE

RESTORE source TO destination (options)

Recovers any files stored on floppy diskettes that were saved with the SAVE command. Because SAVE stores files in a special format, RESTORE is the only way to return these files to the hard disk drive.

source specifies a floppy diskette and is one of the following:

- drive specifies a drive number between 0-3.
- filespec:drive where filespec is a TRSDOS file specification and drive specifies a drive number between 0-3.
- wildcard:drive where wildcard is a standard TRSDOS-16 wildcard and drive specifies a drive number between 0 and 3.

destination is optional, but may be one of the following:

- drive specifies a drive number between 0-7, but may not be the same as source.
- filespec:drive if {options} is {IND}.
If {DIR} is specified in source, destination cannot be specified.

If omitted, destination is first available hard disk drive.

The options and their meanings are:

- ABS** tells TRSDOS-16 to retrieve the specified file(s). If used, TRSDOS-16 overwrites the already existing file with the same name.
- DIR** If VOLUME 0 is in source drive, TRSDOS-16 will display the DATASET directory and identifier; if VOLUME 0 is not a source drive, TRSDOS-16 will display only the DATASET identifier.
- IND** (indirect) tells TRSDOS-16 to use the contents of the destination file as a list of destination filespecs that meet the requirements stated above.
- KILL** deletes the specified destination file before it is opened for RESTOREing.
- PROMPT** asks for verification of each file for RESTOREing. Press <Y> (yes), <N> (no), <Q> (quit)

- restoring), or <S> (stop prompt).
- PRT** can only be used with the DIR option. Prints the DIRectory listing on the line printer
- SYS** specifies that all System files will be retrieved. This includes System (language) and Applications programs. If used with DIR, SYS will list the directory of System files.
- ALL** tells TRSDOS-16 to restore all files. (ALL won't transfer system files, use SYS.) If you use drive as source, you must use ALL.

RESTORE reads information from a DATASET created by SAVE. If a VOLUME of this DATASET is entered out of sequence, TRSDOS-16 informs you of the mistake. The System also informs you if a VOLUME from a different DATASET is accidentally entered during a RESTORE. (See SAVE for explanation of DATASET and VOLUME.)

When you're RESTOREing files in a DATASET, TRSDOS-16 prompts you with:

```
Mount NEXT Diskette in Drive n -- Press ANY Key to continue.
```

which instructs you to enter the next VOLUME of the DATASET.

Example

```
RESTORE Ø {ALL} <ENTER>
```

Restores all SAVED user files on Drive Ø to the first available hard disk drive.

```
RESTORE !:2 TO 4 <ENTER>
```

recovers files from the floppy diskette in Drive 2 and puts them on hard disk Drive 4.

```
RESTORE 1 PROGRAMS {IND} <ENTER>
```

where PROGRAMS is an INDirect file containing the files:

```
MAILIST/PRG:4  
MAILDAT/TXT:4  
CHANGES/TXT:4
```

recovers the files from the floppy diskette in Drive 1, to the filespecs defined in PROGRAMS on Hard Disk Drive 4. Note that "TO" is optional

```
RESTORE */SRC:Ø 4 <ENTER>
```

Restores all user files SAVED with the extension /SRC on Drive Ø to Hard Disk Drive 4 using the same file names.

SAVE

SAVE source TO destination {options}

Creates a serial file-by-file backup of source onto destination. Normally, you'll want to use the SAVE command to backup your hard disk files onto floppy diskette. This backup will be a compact form which consumes approximately half the space that it would be on a standard floppy diskette.

This gives you a floppy diskette copy of your files that can easily be carried to another hard disk system. It can also be used to create a "safe" copy of important files.

The only way to retrieve a file in this "compact" format is with the RESTORE command. Any attempt to access a SAVED diskette using a TRSDOS-16 command will cause the System to appear "locked-up" for a short period of time while TRSDOS-16 attempts to read the SAVED diskette.

source can be one of the following:

drive specifies a drive number between Ø-7, but may not be the same as destination (ALL must be specified).

filespec:drive if {options} is {IND}.

wildcard:drive is a TRSDOS-16 wildcard and includes a drive number (Ø-7).

destination specifies a floppy diskette and is one of the following:

drive specifies a drive number between Ø-3.

options and their meanings are:

- ABS** tells SAVE not to prompt for destination diskette status. It formats the destination diskette if it isn't already in SAVE format.
- DC value date** compares the creation date of each specified source file against the date entered and SAVES the file if all other criteria are met.
- DM value date** uses the last modification date in the manner specified above.
- IND** (indirect) tells SAVE to use the contents of the source file as a list of source filespecs that meet the requirements stated above.
- PROMPT** asks for a file verification before SAVEing. You may respond with <Y> (yes), <N> (no), Q (quit) or <S> (stop prompting and continue).
- ALL** tells TRSDOS-16 to save all files. (ALL won't transfer system files, use SYS.) If you use drive as source, you must use ALL.
- SYS** allows you to SAVE language and application programs.

Note: value is <, >, or = where < (less than) and > (greater than) mean less than or equal to and greater than or equal to.
date must be in the form: MMDDYY

When the ABS option is used with SAVE, TRSDOS-16 will write over any diskette. If ABS is not used, you will be prompted first.

SAVEing Multiple Diskettes

Since the hard disk drive is a larger storage system than the floppy diskette, it is sometimes necessary for SAVE to store information on more than one diskette. In these cases, SAVE prompts for the insertion of a new diskette.

There are two terms relative to SAVE which you need to be familiar with:

DATASET A set of one or more diskettes created by SAVE.

VOLUME An individual diskette that is a member of a DATASET.

TRSDOS-16 numbers the VOLUMES sequentially from 0. Each DATASET contains a unique identifier so each SAVE VOLUME is identified by its serial position in a specific DATASET.

This prevents the accidental mixing of DATASETS within each other.

If a SAVED file requires more than one floppy diskette, the DATASET identifier enables you to keep track of diskettes in the same VOLUME. For instance, DATASET identifier 84 4E 56 may include VOLUMES 0, 1, and 2.

When you are SAVEing files that require more than one Volume, TRSDOS-II prompts with:

```
Insert NEXT Blank Diskette on Drive n --  
Press ANY Key to Continue.
```

When you do this, TRSDOS-16 then prompts with:

```
The Diskette Presently on Drive n  
will be referred to as "VOLUME 1"
```

When all files have been SAVED, TRSDOS-16 then prompts:

```
Insert "VOLUME 0" on Drive 1 --  
Press ANY Key to Continue
```

When you re-insert VOLUME 0, TRSDOS-16 then writes it housekeeping information to this diskette. This allows it to record the number of volumes in the DATASET, etc. for use when it RESTOREs the SAVED files.

Examples

There are a variety of ways to use SAVE. The simplest of these is:

```
SAVE !:4 TO 2 <ENTER>
```

This simply copies all the files on hard disk Drive 4 in a compact form onto the diskette in Drive 2.

WILDCARDING

Wildcards also offer a simplified method of saving files (these can be several files, or an entire disk). For example:

```
SAVE */CBL:4 TO 0 <ENTER>
```

SAVES all files with the extension /CBL from Drive 4 to the diskette in Drive Ø.

USING THE INDIRECT OPTION

The INDirect option allows you to save groups of files by creating an INDirect file (a file consisting of one or more filespecs -- similar to a DO-file). The only way to do this is to create a BUILD file under the TRSDOS-II operating system. (For complete details on BUILD, see your Model II Owner's manual.)

Reset your computer to start-up under TRSDOS-II and when TRSDOS-II Ready is displayed, type:

```
BUILD PROGRAMS <ENTER>
```

TRSDOS-II then will prompt you to enter the command line. To do so, type in the names of the files you wish to store. For example, type:

```
ORDERS:5 <ENTER>  
REPORTS/*:6 <ENTER>
```

and press <BREAK> to return to TRSDOS-II Ready.

You are now ready to SAVE your INDirect file from hard disk to the specially formatted floppy diskette. Type:

```
SAVE PROGRAMS:4 TO Ø {IND} <ENTER>
```

Both ORDERS and REPORTS are now found in the file named PROGRAMS on the floppy diskette in Drive Ø.

NOTE: Because the INDirect option allows you to SAVE multiple files from more than one hard disk, there is a chance that you could SAVE more than one file with the same name. The SAVE and RESTORE DIRectory does not specify drive numbers for files, therefore you could possibly some of the duplicate filenames.

For example, if you created an INDirect file consisting of these files:

```
*/FOR:4  
*/CBL:4  
*/FOR:5
```

there is the chance that there are duplicate filenames on drives 4 and 5. Therefore, before using the INDIRECT option, we suggest that you examine all the files to be SAVED. If there are duplicate names, RENAME those files before SAVEing.

USING THE DC AND DM OPTION

Another way to SAVE files is to do so in respect to their creation or modification date. For example, if your directory showed these creation and update dates for your files:

Filename	Created	Updated
MENU/PRG	6/1/81	9/2/81
PRGONE/PRG	6/1/81	8/16/81
PRGTWO/PRG	6/1/81	7/30/81
PRGTHR/PRG	6/1/81	6/16/81
PAYROLL/DAT	9/15/81	10/15/81
CHECKS/DAT	9/15/81	10/15/81
TEST/PRG	10/29/81	10/29/81

SAVE */PRG:5 TO 0.

The most efficient way to SAVE these files would be by comparing the file creation date to a specified date. For example, all of the first four files were created on June 1, 1981 (6/1/81). Therefore, type:

SAVE */*:5 TO 0 {DC=060181} <ENTER>

and the first four files would be SAVED to the floppy diskette in Drive 0.

In the same sense, the first four files were modified (updated) on or before September 2, 1981 (9/2/81). Therefore, type:

SAVE */PRG:5 TO 0 {DM<091581} <ENTER>

and all files modified before the specified date would be SAVED.

SETCOM

SETCOM {options}

Sets up the A or B channels (on the back panel) for communicating with a remote device, via a modem or hardwire connection.

(If you are not a machine language programmer and want to communicate with a remote device, you need to buy a communications program. The manual that comes with it will explain how to use it. See your Radio Shack store for information.)

SETCOM without any options tells TRSDOS-16 to display the status of both serial channels.

The options are:

A=OFF turns off the A channel's RS-232 Communication settings.

B=OFF turns off the B channel's RS-232 Communication settings.

A=(baud rate,word length,parity,stop bits)
sets the A Channel for RS-232 communication.

B=(baud rate,word length,parity,stop bits)
sets the B Channel for RS-232 communication.

The RS-232 settings can be the following:

<u>baud rate</u>	110, 150, 300, 600, 1200, 2400, 4800, 9600. If not specified, 300 is used. (Some programs will not run correctly at speeds higher than 2400 baud.)
<u>word length</u>	5, 6, 7, 8. If not specified, 7 is used.
<u>parity</u>	E for even, O for Odd, N for none. If not specified, even is used.
<u>stop bits</u>	1, 2. If not specified, 1 is used.

Every option but the last must be followed by a comma. The options are positional; e.g., the third item in an option list must always specify parity. To use a default value, omit the option and insert only the comma.

To change the settings on a currently active channel, first turn the channel OFF. If the channel is already off when you try to turn it off, you'll get an error message.

Before executing this command, connect the remote device to the A or B channel.

Then, after executing it, you can begin sending and receiving data, using one of these TRSDOS-16 Supervisor Calls. (See the Technical Information Section for details.)

ARCV	Channel A receive
ATX	Channel A transmit
BRCV	Channel B receive
BTX	Channel B transmit
ACTL	Channel A control
BCTL	Channel B control

These system routines are only available when the respective channel has been initialized. See Technical Information for details.

Example

```
SETCOM A=( ) <ENTER>
```

sets up channel A for serial communications, using all the default parameters. System function calls 96 and 97 are available for serial I/O. The status of channel B is unchanged.

```
SETCOM B=(600, 8, , 2), A=OFF <ENTER>
```

sets up channel B:

baud rate	600
word length	8 bits
parity	Even (default)
stop bits	2

and turns channel A OFF.

```
SETCOM A=(1200, 8, 0, ), B=( , , , 2) <ENTER>
```

sets up channels A and B.

	Channel A	Channel B
baud rate	1200	300 (default)
word length	8	7 (default)
parity	Odd	Even (default)
stop bits	1(default)	2

SETCOM <ENTER>

displays the status of both channels.

SETCOM A=OFF, A=() <ENTER>

resets channel A to default parameters.

SIZE

SIZE

Returns the amount of user memory currently available.

Example

SIZE <ENTER>

SPOOL

SPOOL {options}

Captures printer output or prints a spool file. SPOOL increases the efficiency of the system by allowing you to use the system while a print operation is in progress.

The {options} control the spool function. If omitted, the SPOOL status is displayed.

The options are:

ON activates the spooler. You must set this switch

- before you can use the other switches.
- OFF** turns off the spooler and closes the capture- and print-files.
- N,F=filespec** creates a capture file named filespec
- P,F=filespec** begins background-printing. filespec is the file to be printed.
- K** keeps the file after printing it. If omitted, deletes the file after printing it. (TRSDOS-16 won't delete a print-file if the file is closed by a SPOOL S or if a disk error occurs in the print file.)
- C=n** specifies the number of copies you want. If omitted, one copy is made. n can be any number from 1 to 255.
- L=line** specifies the line number where printing starts. A line is a sequence of characters terminated by a carriage return. If omitted, printing starts at line one. line may be any number from 1 to 65535.
- H** halts background-printing but saves the current position for later resumption (R switch).
- R,L=line** resumes background-printing after a halt (H switch), or displays the current line number if the spooler has not been halted. If L=line is used, printing resumes at the specified line. If omitted, printing resumes at the point where it was stopped.
- S** stops printing. It closes but doesn't kill the print-file and leaves the capture-file open.

The TRSDOS-16 spooler performs two functions which you can use simultaneously or one at a time:

1. It saves or "captures" the data that normally goes to the printer. The spooler then can either throw away this captured data or save it in a capture-file for later use.
2. It prints data from a disk file while other operations are in progress. That is, you can use the system -- everything except the printer -- while printing the file. While the spool-file is printing, your system captures the real-time printer output for later use.

Example 1

CAPTURE-FILE

In this example, you can run a program that outputs to the printer. Instead of waiting to use your system until the printing is complete, you can capture the program in a disk file to print out later.

To do this, call the capture-file SPOOL1 and type:

```
SPOOL ON <ENTER>
SPOOL N,F=SPOOL1 <ENTER>
```

This saves all printer output in SPOOL1. To stop capturing the printer output in SPOOL1, type:

```
SPOOL OFF <ENTER>
```

Now SPOOL1 is a text file which you can LIST or PRINT in the normal means, but at your convenience.

Example 2**BACKGROUND PRINTING**

Here you can print to a file created by the spooler while you simultaneously use the system. Using the SPOOL1 file from the first example, type:

```
SPOOL ON <ENTER>
SPOOL P,F=SPOOL1 <ENTER>
```

TRSDOS-16 begins printing the file as a "background task", i.e., printing takes place only when the system isn't busy with some higher priority operation such as interpreting and executing your keyboard commands. Because this example doesn't include the K or C=copies option, TRSDOS-16 deletes SPOOL1 after it prints it and prints only one copy.

Type:

```
SPOOL OFF <ENTER>
```

after completing the print-file since the spooler doesn't turn itself off.

Example 3**SIMULTANEOUS CAPTURE-FILE AND BACKGROUND PRINTING**

To save real-time printer output at the same time as the spooler prints a file, you can use this example.

First you need one capture-file (SPOOL1) and one print-file (SPOOL2). To turn the spooler on and begin capturing printer output in SPOOL1, type:

```
SPOOL ON <ENTER>
SPOOL N,F=SPOOL1 <ENTER>
```

You can now use the computer normally until you're ready to print out SPOOL1. To do so, type:

```
SPOOL N,F=SPOOL2 <ENTER>
```

This closes SPOOL1 and makes SPOOL2 the new capture-file. To begin printing SPOOL1, type:

```
SPOOL P,F=SPOOL1 <ENTER>
```

which prints out SPOOL1 and saves any real-time printing in SPOOL2.

If you want to halt the print-file operation, type:

```
SPOOL H <ENTER>
```

This doesn't affect the capture-file operation. To resume printing, type:

```
SPOOL R <ENTER>
```

T

T

Moves the printer to the next page (top of form). This command is like FORMS with the T option.

If you are currently using spooler and it is capturing, T sends Top-Of-Forms character X'OC' to the spooler capture file.

Example

T <ENTER>

starts a new page after printing a file.

TERMINAL

TERMINAL

allows communication between the Model 16 (or the Enhanced Model II) and another computer running a host program. TERMINAL can only be used for transmission and reception of ASCII text rather than machine-language object code.

Input/Output is through Serial Channel A. In most applications, hookup is through telephone lines via a modem.

TERMINAL has three modes of operation, all described in detail in MODES OF OPERATION:

Menu allows you to select or change options, and even execute TRSDOS-16 system commands.

Interactive terminal transmits your keyboard input and displays incoming data.

Transmit from RAM for high-speed transfer of prepared data. Incoming data is displayed on the screen.

SETTING UP

For communications through telephone lines, you need a modem such as the Telephone Interface II, (26-1171), Modem I (26-1172), or Modem II (26-1173), and the RS-232 Cable, 26-4403.

1. Set up the modem according to its instructions, and connect it to Serial Channel A on the back panel of the computer display console. If Serial Channel B is not connected to another device, install the serial terminator on that channel.
2. Set the modem to originate or answer mode -- whichever is the opposite of the host program with which you will communicate. Set it to full or half duplex, again depending on the requirements of the host program.

3. Turn on the modem and the Model 16/Enhanced Model II computer system.
4. Find out what RS-232C parameters are required by the host program you plan to use:
 - Baud Rate
 - Word length
 - Parity
 - Number of stop bits
 Initialize Serial Channel A accordingly (see RUNNING TERMINAL).

Figure 4. Connect RS-232-C Cable from Modem (or other Serial I/O device) to Serial Channel A on the back panel of the Model 16.

Note: In the examples illustrating sample uses of TERMINAL, underlining indicates what you should see on your display. The information following the underlined text is what you type.

RUNNING TERMINAL

1. From TRSDOS-16 Ready, you can start TERMINAL by typing:

```
TERMINAL <ENTER>
```

The program starts up in the Menu mode with the prompt:

```
-- Enter Menu Selection ..
```

Initialize Serial Channel A according to the

requirements (Baud Rate, Word Length, Parity, and Number of Stop Bits) of the host program you will communicate with. Type:

S <ENTER>

When the program prompts you to type in a TRSDOS-16 command, type in the SETCOM command just as you would in the TRSDOS-16 Ready mode. For example:

SETCOM A=(300,7,N,2) <ENTER>

enables Serial Channel A with 300 baud, seven-bit words, no parity and two stop bits. After executing the command, control will return to TERMINAL's Menu mode.

3. If you plan to use the printer option (P) of TERMINAL (described later), initialize the printer now with the FORMS command. Type:

S <ENTER>

and enter the appropriate FORMS command at the prompt.

4. To select another menu command, type in the letter specified in the Menu. (See the Menu Commands Section for a list of the available commands.) To redisplay the entire Menu, type:

M <ENTER>

MODES OF OPERATION

Menu Mode

is an off-line mode, i.e., you cannot transmit characters to the host program, and if characters are sent to you, they will be lost. This is the only mode where you can select Menu options. You can also enter the Transmit from RAM or Interactive Terminal mode from the Menu mode.

Interactive Terminal Mode

sends the characters you type to the host program and displays incoming characters as they are received. If the host program echoes your transmissions, they also will appear on the display; if not, you can select the echo option to instruct TERMINAL to display your keyboard input.

You can save incoming characters in the RAM buffer (R option) and output them to the printer (P option).

If transmission errors occur, TERMINAL displays a descriptive error message and waits for the error condition to be corrected. When it is, normal I/O resumes in the Interactive Terminal mode.

There are three ways to enter this mode:

1. With the T command from the Menu mode.
2. With the O command -- upon completion of an auto sign-on.
3. After transmission from the RAM buffer.

To return to the Menu mode, press <BREAK>

NOTE: Certain hosts will prompt you to use a break character or sequence to initialize transmissions. Since the <BREAK> key sends the program from the Terminal Mode to the Menu Mode, the Model 16 uses <ESC> for this break character. You can also set your own break character or sequence with the B command.

Transmit from RAM (and Auto Sign-On)

sends the contents of the RAM buffer to the host program, and passes control to the Interactive mode. Auto sign-on (O command) works in the same way as transmit from RAM. (The following applies to both operations.)

Load the RAM buffer with prepared text from a disk file with the G option. (If you are using auto sign-on, your auto sign on message is sent.) You can send the data in the RAM buffer one line at a time when the host program prompts you that it is ready (W option), or you can send it in a continuous stream.

During the transmission, your computer displays incoming text on the screen. If the host program echoes your transmissions, you can verify that the data was accurately sent.

During the transmissions, adjust the delay between characters by repeatedly pressing the <up arrow> (faster) and <down arrow> (slower) keys. If echoed data appears garbled, slow down the transmissions. If not, you might want to speed it up.

If TERMINAL receives a break character or sequence in this mode, it pauses until it receives the next character. If an H'13" is received, TERMINAL will pause until an H'11' is received. (By convention, H'13' is called the DC3 signal and means pause; H'11' is called the DC1 signal and means resume).

Use the X command to enter this mode.

To exit this mode and return to the Menu mode, press <BREAK>.

TERMINAL COMMANDS AND OPTIONS

A Build Auto Sign-On Message -- Allows you to prepare an automatic sign-on to be sent to the host with the O option. The message should contain the responses you use to answer the standard sign-on questions provided when you first call a host.

The message can be up to 6Ø keyboard characters, including control characters. All control characters will be displayed as +, but the true control code will actually be sent. (When you display a message, no control codes will be shown.) To imbed a carriage return (H'ØD') in the message, press <down arrow>.

For example, if the host requires responses to these prompts during sign-on:

```
User ID?  
User Password?  
Program Name?
```

instead of typing the information each time you call the host, you can store the responses in an auto sign-on buffer. To store the following information in the buffer:

```
STL-314 <H'ØD'>  
SHOWME <H'ØD>  
MENU <H'ØD'>
```

Type:

--Enter Menu Selection.. A <ENTER>

The Current Auto Sign-On is

Change? (Y/N) Y <ENTER>

Enter Auto Sign-On Message (1-60)

STL-314 <down arrow> SHOWME <down arrow> MENU <ENTER>

The Current Auto Sign-On is

STL-314

SHOWME

MENU

-- Enter Menu Selection ..

The blank line above Change? (Y/N) Y <ENTER> indicates that the original auto sign-on was blank or contained non-display characters.

B Set/Change Break Character or Sequence -- Allows you to select the incoming code that will be interpreted as a "break" and also lets you define a key to send the same break character or sequence.

You can use any code from 0 to 255 as the break character; you can specify any duration from 1 to 451 milliseconds for the break sequence (this is determined by the host program). For the user-defined break key, you can use any key except <BREAK> or <CTRL> <C>.

The following example shows how to set up H'0A' as the break character, and <CTRL> <D> as the break key:

--Enter Menu Selection B <ENTER>

Break Key is Now 1BHex

Change? (Y/N) Y <ENTER>

Enter New Key (1) <CTRL> <D> <ENTER>

Break Key is Now 04 Hex

Type of Break is Now CHR

Change? (Y/N) N <ENTER>

Break Char is Now 03 Hex

Enter new CHAR Value in Hex (2) 0A <ENTER>

Break Char is Now 0A Hex

C Copy RAM Buffer to Disk -- Creates a disk file copy of the text in the RAM buffer. The new file will have a record length of one.

Use this command to save data received into the RAM buffer in the Interactive Terminal mode. To minimize hookup time, do this after ending the connection to the host program. Or

if the RAM buffer is full, save it in a disk file, then reset it and reopen it for more data.

For example, to save a report you have just received in the Interactive Terminal mode as a disk file named REPORT, type:

```
-- Enter Menu Option.. C <ENTER>
Enter Filespec (1-34)
REPORT <ENTER>
```

The new file will be created (if REPORT already exists, it will be overwritten with the new data), and the RAM buffer contents and status will be unchanged.

To stop the copy process, press <BREAK>. The disk file will be closed and you will be returned to the menu.

D Display RAM Buffer -- displays the contents of the RAM buffer. To pause the display, press <HOLD>. To continue, press <HOLD> again. If the printer option is on when you issue this command, the text will also be output to the printer. To enter the command, type:

```
--Enter Menu Selection.. D <ENTER>
```

To stop the display function, press <BREAK>. You will be returned to the menu.

E Toggle Self Echo Option -- Allows you to display the characters you send via the TERMINAL.

Some hosts echo the text you send. As the host receives each character, it sends it right back to you and what you sent is displayed on the screen. When communicating with this type of host, set your modem to full duplex.

If the host does not echo your text, what you send will not be displayed unless you use the self-echo option. With such hosts, set your mode to half duplex.

To toggle the echo option, simply type E <ENTER>. The new state of the option (ON or OFF) will be displayed and the menu prompt will return.

F Set/Change <F1> and <F2> Keys -- Allows you to program <F1> and <F2> to output any code from 0-255. This is useful if you use a particular code frequently.

For example, if the host recognizes H'13' (<CTRL> <S>) as pause control and H'11' (<CTRL> <Q>) as resume control, you may want to change these to <F1> and <F2> for convenience sake. To do this, type:

```
-- Enter Menu Selection.. F <ENTER>
F1 Key Will Send a 01 Hex Code
Change? (Y/N).. Y <ENTER>
Enter New Char Value in Hex (2) 11 <ENTER>
F1 Key Will Send a 11 Hex Code
F2 Key Will Send a 02 Hex Code
Change? (Y/N).. Y <ENTER>
Enter New Char Value in Hex (2).. 13 <ENTER>
F2 Key Will Send a Hex Code
-- Enter Menu Selection ..
```

Now when you type <F1> in the Interactive Terminal Mode, TERMINAL will transmit the resume control H'11'; for <F2>, the pause control H'13'.

G Get Disk File into RAM Buffer -- lets you load text stored in a disk file into the RAM buffer and then send it to the host via the X command (transmit from RAM). The previous contents of the RAM buffer are lost.

The disk file can contain fixed- or variable-length records of any length. However, only ASCII files should be loaded and sent. You can send any programs as long as you saved them in ASCII format.

For example, to send a document stored in the file DOCUMENT/TXT type:

```
--Enter Menu Selection.. G <ENTER>
Enter Filespec (1-34)
DOCUMENT/TXT <ENTER>
```

TERMINAL will load the file and return to the Menu. The RAM buffer will be closed.

If the host program is ready to accept data, you can now send it with the X command. After transmission is complete, TERMINAL will go to the Interactive Terminal mode.

L Toggle Line Feed Option -- tells TERMINAL how to handle an incoming line H'0A'. When the option is on, all line feeds are ignored; when off, they are not ignored.

This is useful if the host always sends a line feed after a carriage return. Since the TRSDOS-16 display and printer drivers automatically perform a line feed after a carriage return is sent, the incoming line feed is redundant. Therefore, the line feed option should normally be on.

To toggle the line feed option, simply type L <ENTER>. The new state of the option (ON or OFF) will be displayed and the Menu prompt will return.

M Display Menu -- Clears the display and redisplay the Menu. Use this command when you have entered so many commands that all the Menu commands are not visible.

O Enter Terminal Mode with Auto Sign-On -- Starts transmission of the current auto sign-on message. After it sends the message, TERMINAL enters the Interactive Terminal mode.

To stop transmitting the auto sign-on, press <BREAK>. This returns control to the menu.

For details, see "Transmitting from RAM."

Note: Most host programs cannot receive anything until they send the first prompting message. Because of this, you should:

1. When connection is first made, go to the Interactive Terminal mode (T option) and wait for the host to send its first prompt character.
2. Press <BREAK> to return to the menu.
3. Start the auto sign-on (O option).

P Toggle Printer Option -- Turns the printer option ON and OFF. When ON, incoming text is copied to the printer as it is received and displayed. Initialize the printer with the FORMS command before you try to use it. When you use the D command while the P option is on, the RAM buffer text is copied to the printer.

TERMINAL uses a circular buffer for efficient output to the printer. If characters come in too fast, they will not be printed. They will be displayed, though, and saved in RAM if the buffer is open. (Check your printer's specifications for maximum character input rate. At 300 baud, 7-bit characters may come in as fast as 30 per second.)

To minimize hookup time, do not use the printer option while on-line with the host. Save the incoming text in RAM and upon completion of the hookup, turn the printer option on and use the D command to get a hard copy of the data.

To toggle the printer option, simply type: P <ENTER>. The new state of the option (ON or OFF) will be displayed and the menu prompt will return.

Q Quit -- returns control to TRSDOS-16. If there is data in the RAM buffer, it is lost; i.e., you cannot restart TERMINAL and recover the data.

R Toggle RAM Buffer Option -- (Interactive Terminal Mode only) lets you save in RAM some or all the data received by "opening" and "closing" the RAM buffer. With this, you can examine the data later with the D command, or save the data in a disk file with the C command.

When you open the RAM buffer, you can either reset it or retain its current contents. If you retain the contents, new incoming text will be loaded after the existing text in the RAM buffer.

To toggle the RAM buffer option, simply type R <ENTER>. The new state of the option (OPEN or CLOSED) will be displayed. If you have just opened the buffer, you will receive the following prompt:

```
RAM Buffer Now Open  
Reset RAM Buffer? (Y/N) ..
```

If you type Y <ENTER>, the buffer will be reset and previous contents will be lost. For more information, see "Using the RAM Buffer".

S Perform System Command -- enters the operating system and allows you to enter a TRSDOS-16 system command. After it executes the system command, control returns to TERMINAL's Menu. A few TRSDOS-16 commands and programs automatically return to TRSDOS-16 Ready. If you execute any of these commands while in TERMINAL, control will not be returned to TERMINAL, but to TRSDOS-16 Ready.

T Enter Terminal Mode -- directly enters the Interactive Terminal mode. When in this mode, press <BREAK> to return to the Menu.

V Toggle Video Filter -- filters out data characters which produce undesirable results when output to the display.

When a character such as ESC(H'1B) is output, it causes Terminal to clear the screen and home the cursor. With the video filter option, you can prevent this by "filtering" these characters from the display. If the RAM buffer is open, they will be saved in RAM, regardless of the state of this option.

The codes (given in hexadecimal) which this option filters are:

01,02,03,04,05,06,07,0B,0C,0E,0F,
10,11,12,13,14,15,16,1E,1F

If Terminal receives any of these characters while the video filter is on, it will display a "+" in its place.

W Set/Change Prompt Wait Character -- allows you to toggle this feature on or off and set a special character as the prompt-wait character to cue the terminal to continue the transmission.

This allows you to use the high speed transmit from RAM mode, even when the host program can accept only one line at time. (It does not affect operation in the Interactive terminal mode.)

Normally, the host program sends a prompt such as a question mark when it is ready for the next line. (A line is defined as a string of characters terminated by a carriage return H'0D'.) In the Interactive Terminal mode, you simply wait until this prompt is displayed; the prompt wait feature makes TERMINAL do the same thing while in the transmit from RAM mode.

You can define the prompt wait character as any keyboard character from H'20' to H'7F'.

Leave the prompt wait feature off when the host program is simply storing characters as received and is not sending a ready-for-next-line prompt. TERMINAL will transmit text from RAM in a continuous stream.

NOTE: When you start the transmit from RAM (X option) or auto sign-on (O option), the first line is sent immediately, without waiting for a prompt. Each subsequent line is then sent after the prompt is received.

To turn the prompt wait feature off, press <HOLD> when the program asks for a new character.

X Transmit RAM Buffer and Enter Terminal Mode -- enters the Transmit from RAM mode where it sends the current contents of the RAM buffer to the host program. When the entire buffer has been sent, TERMINAL goes into the Interactive Terminal mode. For details, see "Transmitting from RAM."

To stop transmission from RAM, press <BREAK>. Control returns to the Menu.

USING THE RAM BUFFER

You can use the RAM buffer to store incoming text (R option) and prepared text from a disk file (G option). This, in turn, allows the stored files to be rapidly sent. The RAM buffer helps reduce costly hookup time by letting you perform time-consuming operations -- preparing data or printing it out -- while TERMINAL is off-line.

If the buffer is filled during a load from disk (G command) or while receiving data in the Interactive Terminal mode, a warning message will be displayed and the buffer will be closed. If you are loading a disk file, control returns to the Menu mode and the buffer will be filled with the data that was loaded.

If you are in the Interactive Terminal Mode, normal I/O will continue, except that it will no longer be saved in the buffer.

Saving the RAM Buffer

When the buffer is filled in the Interactive Terminal Mode (or when you suspect it is almost full):

1. Transmit a pause or break control character to the host program.
2. Press <BREAK> to return to the Menu.

3. Use the C command to copy the contents of the RAM buffer to a disk file.
4. Reset the RAM buffer with the R command.
5. Use the T command to return to the Interactive Terminal Mode.

Opening and Closing the RAM Buffer

To save portions of the text during I/O of the Interactive Terminal Mode, use the R command. Prior to receiving the data you want to save:

1. Transmit a pause or break control character to the host program.
Press <BREAK> to return to the Menu.
3. Use the R command to toggle the RAM buffer status. If it is off, toggle it again to open it. If it is already open, you have the option of resetting it or leaving it as is. To add new data onto the end of old, do not reset it. To delete old data, reset it.
4. Enter the T command to return to the Interactive Terminal Mode.
5. Direct the host program to resume transmission. The data will now be saved in the RAM buffer as it is received.

Saving the Options You Have Selected

You can save these options in a customized version of TERMINAL:

- . Prompt wait and definition of prompting character
- . Definition of break character or sequence from host program and assignment of a break key on your computer
<F1> and <F2> characters
- . Line feed option
- . Printer option
- . Self-echo option
- . Video filter option
- . Auto sign-on option
- . Speed of transmit from RAM and auto sign-on (as set by the "up" and "down" keys). Once you find out the maximum rate of transmission the host program can handle, you can set that as the default rate.

After you select the options for your customized version, use the DUMP command to create a new program file. Terminal resides from H'3000'. Give this customized program a name other than TERMINAL -- and leave the TERMINAL program in its original configuration.

For example, to call your customized version MINE, type:

```
--Enter Menu Selection.. S <ENTER>
Enter TRSDOS Command (1-79)
DUMP MINE START=3000, END=3FFF <ENTER>
```

Now you have a customized version of TERMINAL that starts up when you type:

```
MINE <ENTER>
```

SAMPLE USES

To Send a Program

If you intend to send a program via TERMINAL, you must first store it in an ASCII-format disk file. When you have done this, set up the modem and initialize Serial Channel A as explained previously. See your modem manual for the appropriate procedure for getting on-line.

For example, to send a disk file named "SORTDATA" on Drive 1, get on-line and load the TERMINAL program. Enter the Interactive Terminal mode by typing:

```
Enter Menu Selection.. T <ENTER>
```

Go through the necessary sign-on and when you want to send the program, press <BREAK> to return to the Menu. (If you want to use the prompt wait option, select it now.) Then type:

```
--Enter Menu Selection.. G <ENTER>
Enter Filespec (1-34)
SORTDATA:1 <ENTER>
```

TERMINAL will now load the program into RAM. Make sure the host is ready to receive the program, then type:

--Enter Menu Selection.. X <ENTER>

The Terminal will now send the program to the host. Press <BREAK> if you want to stop the transmission for any reason. This returns control to the Menu. Otherwise, upon completion of the program transmission, control will go into the Interactive Terminal mode.

To Receive a Program

If the host program you are communicating with is ready to send you an ASCII-formatted program, you must first go to the Menu and type:

--Enter Menu Selection.. R <ENTER>

If the buffer is now closed, repeat this command and TERMINAL will display the message:

RAM Buffer Now Open
Reset RAM Buffer (Y/N) Y <ENTER>

This opens and clears the buffer. Now return to the Interactive Terminal mode (T option) and tell the host to send the program.

After you receive the entire program, press <BREAK> to return to the Menu; then type:

-- Enter Menu Selection.. C <ENTER>
Enter Filespec (1-34)
NEWPROG <ENTER>

This copies the program in RAM into a disk file named NEWPROG.

ERROR CONDITIONS

In the Interactive Terminal Mode, Transmit from RAM Mode, or during Auto Sign-on, TERMINAL may detect errors related to the serial transmission. In such cases, it will display an error message in reverse video and, if possible, will continue normal I/O.

The error messages that may occur while you are in the Interactive Terminal Mode are:

- P Parity error. The received character will be after the P.
- O Over-run. At least one character has been received but not picked up by TERMINAL. This occurs if you are in the Menu mode while the host program is sending characters.
- F Framing error. The received character will be displayed after the F. Check your SETCOM parameters to see that they match the requirements host program.

The following errors can occur in any mode except the Menu:

- DATA CARRIER LOST** Check the telephone/modem connection.
- DATA CARRIER RESTORED** TERMINAL will pause until the carrier is restored. If TERMINAL was transmitting from RAM or sending an auto sign-on, it will start over at the beginning of the text when data carrier is restored.
- BREAK SEQUENCE RECEIVED** If the host program sends a break sequence, or sends TERMINAL'S own break character, this message will displayed; if TERMINAL is in the transmit from RAM or auto sign-on mode, it will pause until the next character is received from the host.

TIME

TIME

Displays the date-time string. It works the same way as the DATE system command. The format for the date-time string is:

```
WED MAR 25, 1981 84 -- 16.24.34
```

for Wednesday, March 25, 1981, the 84th day of the year, 4:24:34 p.m.

Example

```
TIME <ENTER>
```

VERIFY**VERIFY {options}**

Sets the verify function ON or OFF. When ON, TRSDOS-16 checks data after each write operation.

The options are:

- ON** tells TRSDOS-16 to check all data, as it writes it
- OFF** turns VERIFY OFF

If you do not specify an option, TRSDOS-16 returns the current status of VERIFY.

When VERIFY is on, TRSDOS-16 reads after each write operation to ensure that the data is readable. If the data is not readable, TRSDOS-16 retries and, if data is still not readable, returns an error message.

If you need to increase the speed of TRSDOS-16, turn VERIFY OFF.

NOTE: TRSDOS always verifies directory writes. The VERIFY function checks only user writes (writing data into a file).

Examples

```
VERIFY ON <ENTER>
```

turns the verify function ON.

```
VERIFY OFF <ENTER>
```

turns the verify function OFF.

```
VERIFY <ENTER>
```

displays the status of the verify switch.

VERSION

VERSION

Displays the version number of the operating system currently in use.

Example

```
VERSION <ENTER>
```

returns -- Version: 4.1 -- indicating the major version level "4", minor version level "1".

TECHNICAL SYSTEM INFORMATION

MEMORY REQUIREMENTS

TRSDOS-16 loads into memory at startup and occupies approximately 48K of memory.

At this time TRSDOS-16 also processes your configuration command file (see **APPENDIX B** for information on the Configuration Command File).

The configuration file tells TRSDOS-16 what files to load into memory for your use. This might include RUNCOBOL, and the Debugger. TRSDOS-16 loads these files into the memory area reserved for TRSDOS-16.

Any memory following the configured files is available to you, the user.

Note: The Editor, Assembler, and Linker load into user memory, not the Configurator memory.

RELATIVE ADDRESSING

TRSDOS-16 loads into memory in a way that is "invisible" to the user. This is TRSDOS-16's way of protecting itself from being modified by other programs.

TRSDOS-16 internally keeps track of two addresses:

- . the BASE address - this is the bottom of user memory. (Memory below this address is reserved for TRSDOS-16 and files designated by the configured file.
- . the BOUNDS address - this is the top address of memory. (H'1FFFF in a 128K Model 16, H'3FFFF in a 256K Model 16, H'5FFFF in a 384K Model 16, and H'7FFFF in a 512K Model 16.)

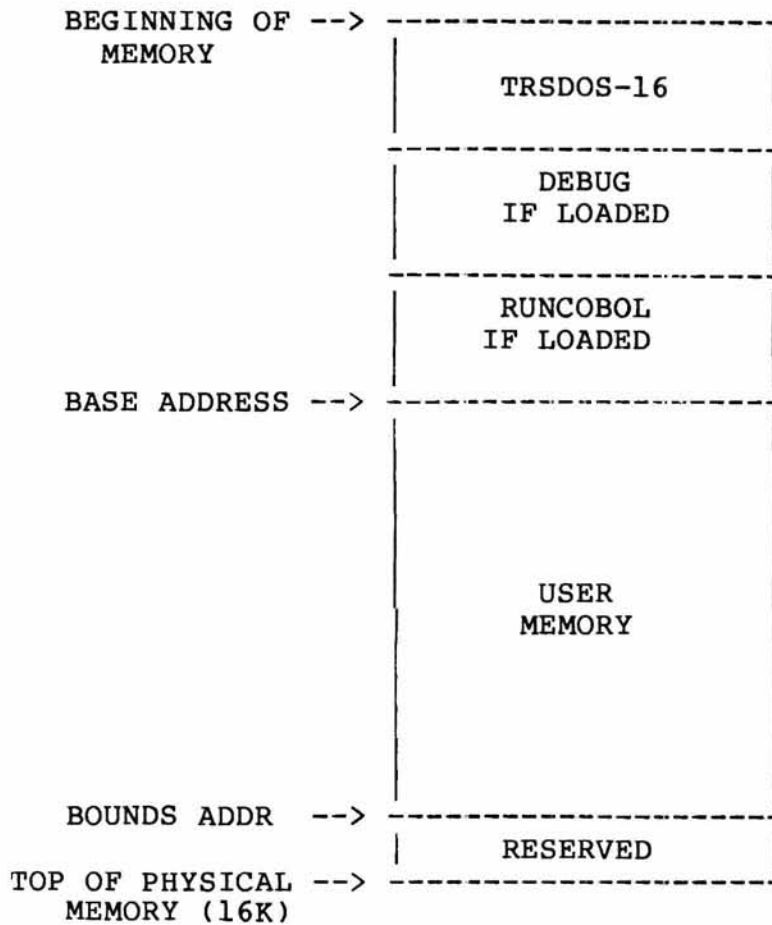

In short:

BOUNDS Address - BASE Address = User Memory

TRSDOS-16 uses the BASE Address to find the physical loading address of your program. When you write a machine-language program, you assign it a "relative loading" address, usually zero. TRSDOS-16 then adds the BASE address to this relative address to determine the physical address where it will load your program:

BASE Address + PROGRAM RELATIVE ADDRESS = PHYSICAL
LOAD ADDRESS

TRSDOS-16 uses the BOUNDS address to find the amount of available user memory. This is how the Operating System determines if your program will fall out of the "bounds" of user memory.

MEMORY CHART

DISK ORGANIZATION

FLOPPY DISKETTE

TRSDOS-16 can use either single-sided (double density) or double-sided (double density) diskettes. However, if you are using an Enhanced Model II, you can use only single-sided diskettes because of the type of drives you have.

TRSDOS-16 will automatically format either single or double-sided diskettes according to the type of diskette.

Each side of the double-sided diskette contains 77 tracks, numbered 0 - 76. Therefore, the double-sided diskette can be thought of as one diskette with 154 tracks.

The single-sided diskette has 77 tracks on one side only.

Each track is made up of 32 sectors, numbered 1-32. Each sector contains 256 bytes, except for track 0 (one side only on the double-sided diskette). This track 0 is reserved for System use and is formatted single-density. It contains 26 sectors and 128 bytes per sector.

The total capacity of a double-sided diskette is:

$$(153 * 32 * 256) + (1 * 26 * 128) = 1,256,704 \text{ bytes}$$

The total capacity of a single-sided diskette is:

$$(76 * 32 * 256) + (1 * 26 * 128) = 625,920$$

HARD DISK

The TRS-80 Hard Disk Drive is organized into 256 "cylinders". Each cylinder is made up of four tracks that have the same radius on each of the four surfaces (4 * 256 = 1024 total tracks per hard disk).

Each track contains 34 sectors, numbered 1-34. Each sector contains 256 bytes.

The total capacity of a hard disk is:

$$(1024 * 34 * 256) = 8,912,896 \text{ bytes}$$

DISK SPACE AVAILABLE TO USER

TRSDOS-16 occupies approximately 31 tracks on the floppy diskette and approximately 32 tracks on the hard disk.

Track 0 is reserved by the System on both the floppy and hard disk. The hard disk also reserves track 1 for diagnostics.

The directory and alternate directory on both the floppy diskettes and hard disk reserve a certain number of tracks, determined by the size of the directories (the size is set by the FORMAT command).

To determine the number of tracks these directories will consume, use this formula:

Directory Space Formula	Description
# of filenames / 4 (round result up to next integer value)	to determine number of sectors used by the primary directory
# of sectors / 32 (floppy) # of sectors / 34 (hard) (round result up to next integer value)	to determine number of tracks used by the primary directory
# of tracks * 2	to determine the total number of tracks used for the primary and alternate directories (the alternate directory is simply a copy of the primary directory)

Note: TRSDOS-16 stores 4 filenames per sector in the directory.

For example, if you use this Format command:

```
FORMAT :1 {PW=PASSWORD,SIZE=25Ø}
```

the directories will consume a total of four tracks:

25Ø filenames / 4	=	62.5
round up	=	63
63 sectors / 32 (floppy)	=	1.96
round up	=	2 tracks for each directory
2 * 2	=	4 total tracks used for the primary and alternate directories.

UNIT OF ALLOCATION

All allocation of disk space is made by single sectors. This means that the smallest non-empty TRSDOS-16 file will consist of one sector.

Single-Sided

Diskette	Tracks	Sectors	Bytes
1	76	2,432	622,592
---	1	32	8,192
---	---	1	256

Double-Sided

Diskette	Cylinders	Tracks	Sectors	Bytes
1	76	154	4,896	1,253,376
---	1	2	64	16,384
---	---	1	32	8,192
---	---	---	1	256

Note: Track 0 on the floppy diskette (only one side for double-sided diskettes) is reserved for System use and is not available for user storage. It is formatted single density with 26 sectors that contain 128 bytes each.

Hard Disk	Cylinders	Tracks	Sectors	Bytes
1	256	1024	34,816	8,912,896
---	1	4	136	34,816
---	---	1	34	8,704
---	---	---	1	256

DISK FILES

METHODS OF FILE ALLOCATION

TRSDOS-16 provides two ways to allocate disk space for files: Dynamic Allocation and Pre-Allocation.

DYNAMIC ALLOCATION

With dynamic allocation, TRSDOS-16 allocates sectors only at the time of write. For example, when a file is first opened for output, no space is allocated. The first allocation of space is done at the first write. Additional space is added as required by subsequent writes.

With dynamically allocated files, unused sectors are de-allocated (recovered) when the file is closed.

Dynamic allocation is the method TRSDOS-16 uses, unless you execute the CREATE system command.

PRE-ALLOCATION

With pre-allocation, the file is allocated a specified number of sectors when it is created. Pre-allocated files can only be created by the system command CREATE.

TRSDOS-16 will dynamically extend (enlarge) a pre-allocated file as needed.

However, TRSDOS-16 will not de-allocate unused sectors when a pre-allocated file is closed. To reduce the size of a pre-allocated file you must copy it to a dynamically allocated file. The COPY system command does this automatically when the destination is a dynamically-allocated file.

RECORD LENGTH

TRSDOS-16 transfers data to and from disks one sector at a time; i.e., in 256-byte blocks. These are the System's "physical" records.

User records or "logical" records are the buffers of data you wish to transfer to or from a file. These can be from 1 to 256 bytes long.

The Operating System will automatically "block" your logical records into physical records which will be transferred to disk, and "de-block" the physical records into logical records which are used by your program.

Therefore, your **only** concern during file-access is with logical records. You never need to worry about physical records, sectors, tracks, etc. This is to your benefit, since physical record lengths and features may change in later TRSDOS versions or with other peripheral devices, while the concept of logical records will not.

From this point on, the term "record" refers to a "logical record".

SPANNING

If the record length is not an even divisor of 256, the records will automatically be spanned across sectors.

For example, if the record length is 200, Sectors 1 and 2 will look like this:

FIXED-LENGTH AND VARIABLE LENGTH RECORDS

TRSDOS-16 files can have either fixed-length or variable-length records. Files with fixed-length records will be referred to as FLRs; files with variable length records, VLRs.

Record length in an FLR file is set when the file is opened for the first time. This length can be any value from 1 to 256 bytes. Once set, the record length in an FLR cannot be changed unless the file is being over-written with new data.

The record-lengths in a VLR file can vary. For example, the first record in a file might have a length of 32; the second, 17; the third, 25 \emptyset ; etc.

The record length in a VLR file is specified in a one-byte length-field at the beginning of each record. The record-length byte indicates the entire length of the record, **including** the length-byte. This can be any value from \emptyset to 255. A value of 1 can be used to mean an empty record (e.g., a blank line in an ASCII text file).

A length-byte value of 2 indicates that the record contains 1 byte of data:

A length-byte value of 16 indicates that the record contains 15 bytes of data:

RECORD NUMBERS

Records are numbered from 0 (beginning of file) to 16,777,214.

A disk file can also contain up to 16,777,216 bytes of storage, however, your storage medium may not be capable of storing this much information.

To determine the number of records a file will hold, use the following formula:

$$16777216 / \underline{\text{logical record length}} = \underline{\text{number of records}}$$

For example:

$$16777216 / 38 = 441,505 \text{ records}$$

Example

If a three megabyte file (possible with hard disk) is opened with a record length of 3 bytes, it would hold approximately 1,000,000 records.

RECORD PROCESSING CAPABILITIES

TRSDOS-16 allows both direct and sequential file access.

Direct access -- sometimes called "random access", allows you to process records in any sequence you specify.

Sequential access allows you to process records in sequence: Record N, N+1, N+2,.... With sequential access, you do not specify a record number; instead, TRSDOS-16 accesses the record following the last record processed, starting with record \emptyset .

FLR files may be opened as either direct access or sequential access.

VLR files can only be opened as sequential access. You cannot position to a specific record in the file, since the varying record lengths make it impossible to calculate the position of the VLRs.

The direct access SVC's are DIRRD (Direct-Read) and DIRWR (Direct-Write). Direct access SVC's always access the record you specify.

The sequential access SVC's are READNX (Read-Next) and WRITNX (Write-Next). Sequential access SVC's always access the record following the last record processed. (When the file is first opened, sequential processing starts with record \emptyset , however DIRWR and DIRRD can be used to position to the EOF, end of file.)

EXAMPLES WITH FIXED LENGTH FILES

Assume you have a Fixed Length Record file currently open. Here are some typical sequences you can accomplish via the file processing routines.

1. **Read and/or write records in the file -- in any order**
This is done using DIRRD and DIRWR SVC's. You could read record 5, write at end of file, read record 3, write record 3, etc.

2. Sequential Read (or Write) beginning anywhere in the file.

First you would do a direct-read to the record where you want to start reading or writing. After that, you would do sequential reads or writes until done (READNX and WRITNX).

3. Sequential Write starting at end of file.

First do a direct-write to the end of the file. Then do sequential writes until done.

4. Determine the number of records in a file.

First do a direct-read to end of file, then use the LOCATE routine to get the current record number, which now equals number of records +1.

EXAMPLES WITH VARIABLE LENGTH RECORDS

Here are examples of ways to read or write VLR files

1. Start reading or writing sequentially at first record

Open the file and start reading or writing sequentially until done.

2. Sequential Write starting at end of file

First do a direct-write to the end of the file. Then do sequential writes until done.

Note: Whenever you write to a VLR, the end of the file is automatically reset to the last record you write.

Also, you cannot update a VLR file directly. You must read in the file, update it and output the updated information to a new VLR file.

SUPERVISOR CALLS

Supervisor Calls (SVCs) are operating system routines available to any user program. These routines alter certain system functions and conditions, provide file access, and perform I/O to the keyboard, video display, and printer.

The available TRSDOS-16 SVCs are:

KEYBOARD SVCs

 KBCHAR
 KBINIT
 KBLINE
 VIDKEY

VIDEO SVCs

 CURSOR
 VDCHAR
 VDINIT
 VDLINE

PRINTER SVCs

 PRCHAR
 PRCTRL
 PRINIT
 PRLINE

SYSTEM CONTROL SVCs

 CLRXIT HLDKEY
 DATE JP2DOS
 DOSCMD SETBRK
 ERRMSG SETTRP
 ERROR VERSION

MISCELLANEOUS SVCs

 DEBUG MOUNT
 DISMOUNT MOVBUF
 EXECUTE RESET

FILE ACCESS SVCs

 CLOSE LOCATE
 CLOSEF OPEN
 DIRRD OPENDO
 DIRRW READNX
 DUMP RENAME
 KILL UNLOCK
 LOAD WRITNX

COMMUNICATIONS SVCs

 ACTL BCTL
 ARCV BRCV
 ATX BTX
 RS232C

Each SVC has a function code which you use to call it. These codes range from 0 to 512.

SVC BLOCK

To use an SVC, you must assign it an area in memory called a BLOCK. You use this BLOCK to pass parameters to and from the SVC.

The SVC block is a maximum of 16 words long. Each word consists of two bytes.

These words are used to store parameters which you want to pass to or from the SVC. They are addressed by their byte-offset number, an even number ranging from 0 to 32. Some SVC's will use only one byte of a word. In this case the byte will be located in the low order 8-bits (or byte-offset + 1). The high order 8-bits must contain zeroes.

Certain parameters, such as memory addresses, will use two consecutive words of storage (called a long word).

You can store an SVC BLOCK anywhere in memory; however, there must be a minimum of 32 bytes available after the starting address of the block, although the block may occupy less than last 32 bytes.

Figure 5 is a sample SVC BLOCK. (DIRWR SVC -- write a record out to disk.)

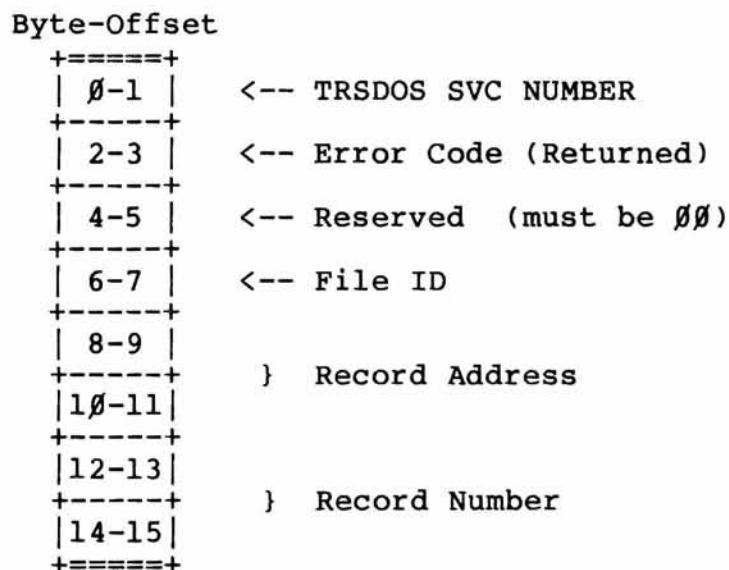

Figure 5. Sample SVC BLOCK

In this illustration, each box represents a word. The numbers within the boxes are the byte-offset numbers for addressing the SVC BLOCK.

The first number (the even number) is used to reference the offset. For example, byte-offset 0-1 contains the SVC number, but is addressed as offset 0.

Byte-offsets 16 through 31 are not used for this SVC, and need not be present.

The first three words of every SVC contain the same information:

```

0-1 TRSDOS Function Code Number (for example, 35)
2-3 On Error, returns the Error Code
4-5 Reserved -- Must contain zero

```

If an area within a block is marked RESERVED, you must set it to zero or a parameter error will occur.

CALLING PROCEDURE

To call a TRSDOS-16 SVC:

1. Load the address of the desired SVC BLOCK into register A0.
2. Execute a BRK #0 instruction
3. Upon return from an SVC, you must specifically TEST for for an error condition if you want to see if one exists.

During the execution of an SVC, the SVC processor does not alter any registers, nor does it alter any status bits upon return.

Figure 6 is part of a sample program for the DIRWR SVC. We'll look at it closely to see one of the ways to load a SVC BLOCK for execution.

This sample assumes that the File Identification Number was previously stored in register A1, Record Address in register A2, and Record Number in register A3.

```

WRITE      :
           LDA      .A0,SVC BLOCK          * line 1
           MOVW    @A0,#DIRWR SVC NUMBER  * line 2
           STW     A1,6@A0                 * line 3
           STL     A2,8@A0                 * line 4
           STL     A3,12@A0                * line 5
           BRK     #0                       * line 6
           TESTW   2@A0                     * line 7
           BNE     ERROR                    * line 8
           :
           :
SVC BLOCK  :
           RDATAB  32,0                     * line 9
DIRWR SVC NUMBER EQUW 44                    * line 10

```

Figure 6. Sample Program

In this program, line 1 loads the address of the SVC BLOCK into register A0.

Line 2 moves the function code number to byte-offset 0 and line 3 stores the file identification number in byte-offset 6.

Lines 4 and 5 store the Record Address and the Record Number in byte-offsets 8 and 12, respectively. Each is a long word.

Line 6 executes the SVC.

Line 7 tests for an error returned at offset 2.

If there is an error, the return is non-zero and line 8 either branches to an ERROR handling subroutine elsewhere in the program or executes the next line of the program.

Line 9 defines the SVC BLOCK to 32 bytes of zeroes.

And line 10 equates the SVC NUMBER to 44.

PROGRAMMING WITH USER INTERRUPTS

TRSDOS-16 allows user-programmed interrupts as described under SETBRK and SETTRP. When the interrupt is received (that is, when the <BREAK> key is pressed or a system trap is taken), control transfers to your interrupt handling routine.

When SETBRK terminates, or when an intercepted interrupt occurs, the following takes place:

1. The current User PC and status registers are pushed on the USER stack.
2. A branch is taken to the user-specified address.

Before doing any processing, you should save any registers you plan to alter. When processing is complete, execute an RTR instruction (return with restore) to return to the interrupted program.

A fatal error occurs if TRSDOS-16 cannot push three words onto the user stack, i.e., if the stack pointer contains a H'4 or less.

NOTE: Interrupt handlers entered this way are also subject to interrupts.

CONVERSION OF RELOCATABLE TO REAL ADDRESSES

If a byte-offset of an SVC 'points' to a buffer in user memory, the following restrictions apply:

All buffers are checked against their maximum possible sizes. It is not permissible to have a 256-byte buffer beginning 25 bytes from the end of memory. The check is made in this way:

1. DATE SVC buffer requires 26 bytes
2. ERRMSG SVC buffer requires 80 bytes
3. OPEN SVC parameter list requires 5 bytes

4. Any call passing a filespec (KILL, RENAME, etc.) requires a 34-byte buffer
5. Any Disk I/O call passing a buffer address is checked for a 256-byte buffer
6. Any miscellaneous I/O calls (PRLINE, VDLINE, etc.) passing a fixed length buffer is checked for 256 bytes.

ACTL
Control Channel A

Function Code 100

Performs control functions on serial channel A and then returns its status.

TRSDOS-16 sets up A/BRCV, A/BTX and A/BCTL when you initialize channel A/B with RS232C. If you call any of these routines while the channel is not initialized (active), you will get an error return code of 1 (no function code exists).

Entry Conditions

Byte-offset	0-1	100
	6-7	<u>option switch</u>

Exit Conditions

Byte-offset	2-3	<u>error code</u>
	8-9	<u>communications status code</u>

Valid option switch settings are:

option switch	Meaning
0	Get status of serial channel into the Status Value
1	Get received buffer count into the Status Value
2	Turn on Request to Send (RTS) signal
3	Turn off RTS
4	Start transmission of a BREAK sequence
5	Stop transmission of a BREAK sequence
6	Clears receive buffer
7	Reset SIO Error condition

The 8-bit grouping of flags returned in the communications status code are:

Bit	Meaning
0	Clear to Send not present
1	Unused
2	Transmitter busy
3	Modem data carrier not present
4	Parity error in byte now being received
5	Data overflow due to a byte now being received
6	Framing error in a byte now being received
7	Break Sequence now being received

Example

```

      .
      .
ACTL  LDA      .A0,SVC BLOCK
      MOVW    @A0,#ACTL SVC NUMBER
      MOVW    6@A0,#OPTION SWITCH
      BRK     #0
      TESTW   2@A0
      BNE     ERROR
      .
      .
SVC BLOCK
      RDATA  32,0
ACTL SVC NUMBER
      EQU    100
OPTION SWITCH
      EQU    0

```

ARCV
Channel A Receive

Function Code 96

Returns a single character from serial channel A.

TRSDOS-16 sets up A/BRCV, A/BTX and A/BCTL when you initialize channel A/B with RS232C. If you call any of these routines while the channel is not initialized (active), you will get an error return code of 1 (no function code exists).

INPUT BUFFER

Each channel (A and B) has its own internal 16-character receive buffer to reduce overruns when receiving data at high speeds. This buffer is a First-In, First-Out buffer (FIFO) and is established when the channel is initialized.

When a character is received by the ARCV and BRCV SVC's, it is stored in this buffer along with its status when it was received.

Each time a new character is received into the buffer the character at the top of the buffer (oldest character) is pushed into the character returned byte-offset and its status (stored in the buffer when it was received) is pushed into the communications status code byte-offset.

An overrun occurs only when the 17th character is received into the already-full buffer. The 16th character is replaced with the 17th. When the character that caused the overrun is retrieved into the character returned byte-offset, an overrun will be indicated in communication status code.

If there are no characters "waiting" in the buffer, the communications status code will reflect the current status of the serial interface.

Entry Conditions

Byte-offset Ø-1 96

Exit Conditions

Byte-offset	2-3	<u>error code</u>
	6-7	<u>character returned</u> (if any)
	8-9	<u>communications status code</u>
	10-11	<u>character received status</u>
		Ø = character received
		non-zero = character not received

The 8-bit grouping of flags returned in the communications status code are:

Bit	Meaning
Ø	Clear to Send not present
1	Unused
2	Transmitter busy
3	Modem data carrier not present
4	Parity error in byte now being received
5	Data overflow due to a byte now being received
6	Framing error in a byte now being received
7	Break Sequence now being received

Example

```

ARCVC      LDA      .AØ,SVC BLOCK
           MOVW    @AØ,#ARCVC SVC NUMBER
           BRK     #Ø
           TESTW  2@AØ
           BNE    ERROR

```

```

SVC BLOCK
          RDATA B  32,Ø
ARCVC SVC NUMBER
          EQUW   96

```

ATX
Channel A Transmit

Function Code 97

Outputs a single character to serial channel A.

TRSDOS-16 sets up A/BRCV, A/BTX and A/BCTL when you initialize channel A/B with RS232C. If you call any of these routines while the channel is not initialized (active), you will get an error return code of 1 (no function code exists).

Data bytes will be transmitted even if no carrier is present. You must check the communication status code and character transmitted status for error conditions.

Entry Conditions

Byte-offset	Ø-1	97
	6-7	<u>character to be sent</u>

Exit Conditions

Byte-offset	2-3	<u>error code</u>
	8-9	<u>communications status code</u>
	1Ø-11	<u>character transmitted status</u>
		Ø = character transmitted
		non-zero = character not transmitted

The 8-bit grouping of flags returned in the communications status code are:

Bit	Meaning
Ø	Clear to Send not present
1	Unused
2	Transmitter busy
3	Modem data carrier not present
4	Parity error in byte now being received *
5	Data overflow due to a byte now being received *
6	Framing error in a byte now being received
7	Break Sequence now being received *

Bits 4 - 7 are only used when the character was not sent

Example

```
      .  
      .  
ATX   LDA      .A0,SVC BLOCK  
      MOVW    @A0,#ATX SVC NUMBER  
      MOVW    6@A0,#CHAR TO SEND  
      BRK     #0  
      TESTW   2@A0  
      BNE     ERROR  
      .  
      .  
SVC BLOCK RDATA0 32,0  
ATX SVC NUMBER EQU 97  
CHAR TO SEND TEXT 'G
```

BCTL
Control Channel B

Function Code 101

Performs control functions on serial channel B and then returns its status.

Entry Conditions

Byte-offset	0-1	101
	6-7	<u>option switch</u>

Exit Conditions

Byte-offset	2-3	<u>error code</u>
	8-9	<u>communication status code</u>

Valid option switch settings are:

Option Switch	Meaning
0	Get status of serial channel into the Status Value
1	Get received buffer count into the Status Value
2	Turn on Request to Send (RTS) signal
3	Turn off RTS
4	Start transmission of a BREAK sequence
5	Stop transmission of a BREAK sequence
6	Clears receive buffer
7	Reset SIO Error condition

The 8-bit grouping of flags returned in the communications status code are:

Bit	Meaning when set
0	Clear to Send not present
1	Unused
2	Transmitter busy
3	Modem data carrier not present

Bit	Meaning when set
4	Parity error in byte now being received
5	Data overflow due to a byte now being received
6	Framing error in a byte now being received
7	Break Sequence now being received

Example

```

      .
      .
BCTL  LDA      .A0,SVC BLOCK
      MOVW    @A0,#BCTL SVC NUMBER
      MOVW    6@A0,#OPTION SWITCH
      BRK     #0
      TESTW   2@A0
      BNE     ERROR
      .
      .
SVC BLOCK
      RDATA B 32,0
BCTL SVC NUMBER
      EQU    101
OPTION SWITCH
      EQU    0

```

BRCV
Channel B Receive**Function Code 98**

Returns a single character from serial channel B.

TRSDOS-16 sets up A/BRCV, A/BTX and A/BCTL when you initialize channel A/B with RS232C. If you call any of these routines while the channel is not initialized (active), you will get an error return code of 1 (no function code exists).

INPUT BUFFER

Each channel (A and B) has its own internal 16-character receive buffer to reduce overruns when receiving data at high speeds. This buffer is a First-In, First-Out buffer (FIFO) and is established when the channel is initialized.

When a character is received by the ARCV and BRCV SVC's, it is stored in this buffer along with its status when it was received.

Each time a new character is received into the buffer the character at the top of the buffer (oldest character) is pushed into the character returned byte-offset and its status (stored in the buffer when it was received) is pushed into the communications status code byte-offset.

An overrun occurs only when the 17th character is received into the already-full buffer. The 16th character is replaced with the 17th. When the character that caused the overrun is retrieved into the character returned byte-offset, an overrun will be indicated in communication status code.

If there are no characters "waiting" in the buffer, the communications status code will reflect the current status of the serial interface.

Entry Conditions

Byte-offset Ø-1 98

Exit Conditions

Byte-offset	2-3	<u>error code</u>
	6-7	<u>character returned (if any)</u>
	8-9	<u>communications status code</u>
	10-11	<u>character received status</u>
		0 = character received
		non-zero = character not received

The 8-bit grouping of flags returned in the communication status code are:

Bit	Meaning
0	Clear to Send not present
1	Unused
2	Transmitter busy
3	Modem data carrier not present
4	Parity error in byte now being received
5	Data overflow due to a byte now being received
6	Framing error in a byte now being received
7	Break Sequence now being received

Example

```

      .
      .
BRCV  LDA      .A0,SVC BLOCK
      MOVW    @A0,#BRCV SVC NUMBER
      BRK     #0
      TESTW   2@A0
      BNE     ERROR
      .
      .
SVC BLOCK
      RDATA B  32,0
BRCV SVC NUMBER
      EQU    98

```

BTX
Channel B Transmit

Function Code 99

Outputs a single character to serial channel B.

TRSDOS-16 sets up A/BRCV, A/BTX and A/BCTL when you initialize channel A/B with RS232C. If you call any of these routines while the channel is not initialized (active), you will get an error return code of 1 (no function code exists).

Data bytes will be transmitted even if no carrier is present. You must check the communication status code and character transmitted status for error conditions.

Entry Conditions

Byte-offset	Ø-1	99
	6-7	<u>character to be sent</u>

Exit Conditions

Byte-offset	2-3	<u>error code</u>
	8-9	<u>communications status code</u>
	1Ø-11	<u>character transmitted status</u>
		Ø = character transmitted
		non-zero = character not transmitted

The 8-bit grouping of flags returned in the communications status code are:

Bit	Meaning
Ø	Clear to Send not present
1	Unused
2	Transmitter busy
3	Modem data carrier not present
4	Parity error in byte now being received *
5	Data overflow due to a byte now being received *
6	Framing error in a byte now being received *
7	Break Sequence now being received *

* Bits 4 - 7 are only used when the character was not sent

Example

```
      .  
      .  
BTX   LDA      .A0,SVC BLOCK  
      MOVW    @A0,#BTX SVC NUMBER  
      MOVW    6@A0,#CHAR TO SEND  
      BRK     #0  
      TESTW   2@A0  
      BNE     ERROR  
      .  
      .  
SVC BLOCK  
      RDATA B 32,0  
BTX SVC NUMBER  
      EQUW   99  
CHAR TO SEND  
      TEXT  'G
```

CLOSE
Close Disk Files

Function Code 42

Terminates output to a specified file. This SVC first writes all unsaved data to disk, then updates the directory.

Entry Conditions

Byte-offset	0-1	42
	6-7	<u>file identification number</u>

Exit Conditions

Byte-offset	2-3	<u>error code</u>
-------------	-----	-------------------

The file identification number is a unique number assigned to each file when it is opened.

Example

In this example the file identification number was previously stored in register A1.

```

      .
CLOSE  LDA      .A0,SVC BLOCK
        MOVW    @A0,#CLOSE SVC NUMBER
        STW     .A1,6@A0
        BRK     #0
        TESTW   2@A0
        BNE     ERROR
      .
SVC BLOCK
      RDATA    32,0
CLOSE SVC NUMBER
      EQU     42

```

CLOSEF
Close Files

Function Code 133

Closes all open files, except for a currently executing DO-file, SPOOL file, or a file opened by OPENDO.

Entry Conditions

Byte-offset \emptyset -1 133

Exit Conditions

Byte-offset 2-3 error code

Example

```

      .
      .
CLOSEF  LDA      .A $\emptyset$ ,SVC BLOCK
        MOVW    @A $\emptyset$ ,#CLOSEF SVC NUMBER
        BRK     # $\emptyset$ 
        TESTW   2@A $\emptyset$ 
        BNE     ERROR
      .
      .
SVC BLOCK
        RDATA  32, $\emptyset$ 
CLOSEF SVC NUMBER
        EQU   265

```

CLREXIT **Function Code 257**
Clear User Memory and Jump to TRSDOS-16

Clears (writes binary zeroes) to user memory, then gives control to TRSDOS-16 Ready. If used with a DO-File, control proceeds to the next command in the DO-File.

Entry Conditions

Byte-offset 0-1 257

Exit Conditions

Byte-offset 2-3 error code

Example

```

      .
      .
CLRXIT  LDA      .A0,SVC BLOCK
        MOVW    @A0,#CLRXIT SVC NUMBER
        BRK    #0
      .
      .
SVC BLOCK
        RDATA  32,0
CLRXIT SVC NUMBER
        EQU   257

```

CURSOR
Position Cursor

Function Code 10

Positions the cursor to specified screen coordinates. This routine treats ROW and COLUMN as Modulo 24 and Modulo 80, respectively.

Entry Conditions

Byte-offset	0-1	10
	6-7	<u>row to position cursor</u>
	8-9	<u>column to position cursor</u>

Exit Conditions

Byte-offset	2-3	<u>error code</u>
-------------	-----	-------------------

Example

```

      .
      .
CURSOR  LDA      .A0,SVC BLOCK
        MOVW    @A0,#CURSOR SVC NUMBER
        MOVW    6@A0,#ROW POSITION
        MOVW    8@A0,#COLUMN POSITION
        BRK     #0
        TESTW   2@A0
        BNE    ERROR
      .
      .
SVC BLOCK
        RDATA  32,0
CURSOR SVC NUMBER
        EQU   10
ROW POSITION
        EQU   12
COLUMN POSITION
        EQU   40

```

DATE
Return Date String

Function Code 45

Returns the time and date as a 26-byte ASCII string with eight fields.

CONTENTS OF TIME/DATE STRING (SAMPLE)

```

-----
|S A T |A P R| 2 8 |1 9 7 9|1 1 8 |1 3 . 2 0 . 4 2| 4 | 5 |
-----
|      |      |      |      |      |      |      |      |
NAME OF MON. DAY OF YEAR DAY OF TIME MON. DAY
DAY      MON.      YEAR YEAR      #      OF WEEK

```

For example:

SATAPR28197911813.20.42045

represents the data "Saturday, April 28, 1979, the 118th day of the year, 13:20:42 hours, the fourth month of the year, the fifth day of the week".

Monday is considered day 0. The date calculations are based on the Julian Calendar.

Entry Conditions

Byte-offset 0-1 45
6-9 address of 26-byte buffer

Exit Conditions

Byte-offset 2-3 error code

Example

```

.
.
DATE   LDA      .A0,SVC BLOCK
        MOVW    @A0,#DATE SVC NUMBER
        LDA     .A1,DATE BUFFER
        STL     .A1,6@A0
        BRK    #0
        TESTW  2@A0

DEBUG
Load the Debugger

Function Code 259

Turns the debugger on and off. This call is valid only if DEBUG was configured. See Appendix B of this section for more information on the Configuration Command File.

Entry Conditions

Byte-offset 0-1 259
 6-7 function code

Exit Conditions

Byte-offset 2-3 error code

Valid function codes are:

FUNCTION CODE	FUNCTION
0	Turns DEBUG off
1	Turns DEBUG on
2	Enters DEBUG

If you use function code 2, the Debugger will load with the PC register set to the current instruction address plus two.

Example

```

      .
      .
DEBUG  LDA      .A0,SVC BLOCK
      MOVW     @A0,#DEBUG SVC NUMBER
      MOVW     6@A0,#DEBUG ON
      BRK      #0
      TESTW    2@A0
      BNE      ERROR
      .
      .

```

SVC BLOCK		
	RDATAB	32,0
DEBUG SVC NUMBER		
	EQUW	259
DEBUG ON		
	EQUW	i

DIRRD
Direct Read

Function Code 35

Reads a specified record of an FLR (fixed-length record) file.

If you have a VLR (variable-length record) file, you can use DIRRD to read only the first record (0) or the end of file (-1)

Entry Conditions

Byte-offset	0-1	35
	6-7	<u>file identification number</u>
	8-11	<u>record buffer address</u>
	12-15	<u>record number</u>
		0 = position to beginning of file
		H'FFFFFFFF = position to end of file
	16	<u>record lock flag</u>

Exit Conditions

Byte-offset	2-3	<u>error code</u>
-------------	-----	-------------------

The file identification number is a unique number assigned to each file when it is opened.

The record buffer address is a 32 bit address that points to the beginning of a 256-byte Record Buffer; that is where the record will be placed after the disk read.

The record number is a 32 bit number specifying the desired record number.

If the record lock flag is non-zero, the specified record remains locked until the user program performs an UNLOCK on the record.

If the record lock flag is zero, the record is not locked.

Example

Before executing this program, store the File Identification Number in register A1 and the Record Number in register A3.

```

      .
      .
READ   LDA      .A0,SVC BLOCK
      MOVW     @A0,#DIRRD SVC NUMBER
      STW      .A1,6@A0
      LDA      .A2,RECORD BUFFER
      STL      .A2,8@A0
      STL      .A3,12@A0
      BRK      #0
      TESTW    2@A0
      BNE      ERROR
      .
      .
      .
SVC BLOCK
      RDATA B  32,0
DIRRD SVC NUMBER
      EQU      35
RECORD BUFFER
      RDATA B 256,0

```

DIRWR
Direct Write

Function Code 44

Writes a specified record in an FLR (fixed length record) file.

With a VLR (variable length record) files, you can use DIRWR to write only the first record (Ø) or the end of the file (-1).

Entry Conditions

Byte-offset	Ø-1	44
	6-7	<u>file identification number</u>
	8-11	<u>record buffer address</u>
	12-15	<u>record number</u>
		Ø = position to beginning of file
		H'FFFFFFFF = position to end of file

Exit Conditions

Byte-offset	2-3	<u>error code</u>
-------------	-----	-------------------

The file identification number is a unique number assigned to each file when it is opened.

The record buffer address is a 32-bit address that points to the beginning of a 256-byte Record Buffer; that is where the record will be placed after the disk read.

The record number is a 32-bit number specifying the desired record number.

Example

Before executing this program, store the Identification Number in register A1, Record Address in register A2, and Record Number in register A3.

```

WRITE      .
           .
           .LDA      .AØ,SVC BLOCK
           MOVW     @AØ,#DIRWR SVC NUMBER

DISMOUNT
Dismount Disk

Function Code 139

Logically disconnects a MOUNTed disk device. This command is valid for drives 0-3 and 5-7 for hard disk users and drives 1-3 for floppy disk users. The system disk may not be DISMOUNTed.

A DISMOUNT/MOUNT sequence is required for each diskette swap. (see Chapter 1)

You should make sure all files are closed before executing a DISMOUNT/MOUNT sequence

Entry Conditions

Byte-offset	0-1	139
	6-9	<u>device name</u>

Exit Conditions

Byte-offset	2-3	<u>error code</u>
-------------	-----	-------------------

Valid device names are:

FD00	= floppy drive 0
FD01	= floppy drive 1
FD02	= floppy drive 2
FD03	= floppy drive 3
HD00	= hard drive 4
HD01	= hard drive 5
HD02	= hard drive 6
HD03	= hard drive 7

Example

```

      .
      .
DISMNT LDA      .A0,SVC BLOCK
      MOVW     @A0,#DISMNT SVC NUMBER
      LDA     .A1,DEVICE NAME
      MOVL    6@A0,@A1
      BRK     #0
      TESTW   2@A0
      BNE     ERROR
      .
      .

```

SVC BLOCK
 RDATA 32,Ø
DISMNT SVC NUMBER
 EQUW 139
DEVICE NAME
 TEXT 'FDØ1'

DOSCMD
Execute TRSDOS-16 Command

Function Code 27Ø

Passes a command string to the TRSDOS-16 Ready mode for execution. After execution is complete, control returns to TRSDOS-16 Ready.

This command alters the buffer used by the MOVBUF SVC.

When chaining programs, do not use DOSCMD to execute the programs. Use EXECUT instead.

Entry Conditions

Byte-offset	Ø-1	27Ø
	6-7	<u>length of string</u>
	8-11	<u>address of string</u>

Exit Conditions

Byte-offset	2-3	<u>error code</u>
-------------	-----	-------------------

Example

```

      .
      .
DOSCMD  LDA      .AØ,SVC BLOCK
        MOVW    @AØ,#DOSCMD SVC NUMBER
        MOVW    6@AØ,#STRING LENGTH
        LDA     .A1,STRING
        STL     .A1,8@AØ
        BRK    #Ø

        EQUW   5
STRING
        TEXT   'DIR 3'

```

DUMP
Dump Memory to Disk

Function Code 130

Writes a 68000 format program from memory to diskette. The Dump replaces any existing file with the same name.

Entry Conditions

Byte-offset	0-1	130
	6-9	<u>filespec address</u>
	10-13	<u>start dump address</u>
	14-17	<u>end dump address</u>
	18-21	<u>relocation address</u>
	22-25	<u>transfer Address</u>

Exit Conditions

Byte-offset	2-3	<u>error code</u>
-------------	-----	-------------------

filespec address specifies the memory location of a standard TRSDOS-16 file specification. The filename is an ASCII string terminated by a carriage return.

start dump address and end dump address are the beginning and ending locations in memory where the program resides.

relocation address is the starting location where you want the file to load. If you don't want to relocate the file, set the relocation address at 0.

transfer address is the program entry point (the address of the first instruction to execute). If you specify a relocation address, this address offsets the transfer address.

Note: all addresses must be an even value.

Example

```
DUMP      .
          LDA      .A0,SVC BLOCK
          MOVW     @A0,DUMP SVC NUMBER
```

```

LDA      .A1, FILE NAME
STL      .A1, 6@A0
MOVL     10@A0, #START AND TRANS ADDRESS
MOVL     14@A0, #END DUMP ADDRESS
MOVL     18@A0, #RELOCATION ADDRESS
MOVL     22@A0, #START AND TRANS ADDRESS
BRK      #0
TESTW    2@A0
BNE      ERROR

```

```

  EQU      EQU      H'600000
END DUMP ADDRESS
  EQU      EQU      H'600000
RELOCATION ADDRESS
  EQU      EQU      0

```

ERRMSG
Error Message

Function Code 52

In response to a requested error number, this routine returns an 80-byte descriptive error message to a specified buffer area.

Entry Conditions

Byte-offset	0-1	52
	6-7	<u>error number</u>
	8-11	<u>message buffer address</u>

Exit Conditions

Byte-offset	2-3	<u>error code</u>
-------------	-----	-------------------

The error number range is 0 to 255, inclusive.

Example

```

      .
      .
ERRMSG  LDW      .A1,2@A0
        LDA      .A0,SVC BLOCK
        MOVW     @A0,#ERRMSG SVC NUMBER
        STW      .A1,6@A0
        LDA      .A1,MESSAGE BUFFER
        STL      .A1,8@A0
        BRK      #0

        RDATA B  80,0

```

ERROR

Function Code 39

Display Error Number

Displays the message ERROR followed by the specified error code at the current cursor position.

Entry Conditions

Byte-offset	0-1	39
	6-7	<u>error number</u>

Exit Conditions

Byte-offset	2-3	<u>error code</u>
-------------	-----	-------------------

The error number is a 0 - 255 code of the message you want displayed.

Example

```

      .
      .
ERROR  LDW      .A1,2@A0
      LDA      .A0,SVC BLOCK
      MOVW    @A0,#ERROR SVC NUMBER
      STW     .A1,6@A0
      BRK     #0
      TESTW   2@A0
      BNE     JP2DOS
      .
      .
SVC BLOCK
      RDATA   32,0
ERROR SVC NUMBER
      EQU    39

```

EXECUT
Execute Program

Function Code 263

Begins program execution in user memory.

Entry Conditions

Byte-offset	0-1	263
	6-7	00 (Reserved)
	8-11	<u>filespec address</u>

Exit Conditions

Byte-offset	2-3	<u>error code</u>
-------------	-----	-------------------

The filespec address is the 32-bit address of a valid TRSDOS-16 filespec terminated by a carriage return.

Example

```

      .
      .
EXECUTE  LDA      .A0,SVC BLOCK
          MOVW    @A0,#EXECUTE SVC NUMBER
          MOVW    6@A0,#00
          LDA     .A1,FILENAME
          STL     .A1,8@A0
          BRK     #0
          TESTW   2@A0
          BNE     JP2DOS
      .
      .
SVC BLOCK
          RDATA  32,0
EXECUTE SVC NUMBER
          EQU    263
FILENAME
          TEXT   'TEST/CMD'
          DATAB  H'0D

```

HLDKEY
Enable Hold Key

Function Code 29

Suspends and restarts terminal output whenever you press the <HOLD> key.

This SVC must first be enabled. Then you must periodically call HLDKEY to check if the <HOLD> key has been depressed. This places the program in control of the pause checking.

Note that execution of certain DOSCMDs might alter the HLDKEY status. This will happen if the TRSDOS-16 command issues HLDKEY requests.

Entry Conditions

Byte-offset 0-1 29
 6-7 function code

Exit Conditions

Byte-offset 2-3 error code

The HLDKEY function codes are:

Code	Meaning
0	Turn off HOLD processor. Pressing <HOLD> generates H'00'.
1	Turn on HOLD processor. <HOLD> key doesn't generate keyboard data, it is intercepted by TRSDOS-16.
2	Check for <HOLD> key. If pressed, wait until pressed again.

Example

```

      .
      .
HLDKEY  LDA      .A0,SVC BLOCK
        MOVW    @A0,#HLDKEY SVC NUMBER
        MOVW    6@A0,#HOLD KEY FUNCTION CODE
  
```

```
BRK      #0
TESTW    2@A0
BNE      ERROR
```

* CHECK TO SEE IF HOLD KEY PRESSED

```
LDA      .A0,SVC BLOCK
MOVW     @A0,#HLDKEY SVC NUMBER
MOVW     6@A0,#CHECK IF HOLD KEY WAS PRESSED
BRK      #0
TESTW    2@A0
BNE      ERROR
```

.
.

```
SVC BLOCK
          RDATA      32,0
HLDKEY SVC NUMBER
          EQU        29
HOLD KEY FUNCTION CODE
          EQU        1
CHECK IF HOLD KEY PRESSED
          EQU        2
```

JP2DOS
Jump to TRSDOS-16

Function Code 264

After closing all open files and performing system housekeeping, returns control to TRSDOS-16 Ready.

If a program under the control of a DO-file executes this routine, control proceeds to the next command in the DO-file.

Entry Conditions

Byte-offset	0-1	264
	6-7	00 (Reserved)

Exit Conditions

Byte-offset	2-3	<u>error code</u>
-------------	-----	-------------------

Example

```

      .
      .
JP2DOS  LDA      .A0,SVC BLOCK
        MOVW    @A0,#JP2DOS SVC NUMBER
        BRK    #0
      .
      .
SVC BLOCK  RDATA  32,0
JP2DOS SVC NUMBER
        EQUW   264

```

KBCHAR
Keyboard Character

Function Code 4

Checks the keyboard for a new character entry.

If characters are present in the key-ahead buffer, the first character in the buffer will be returned in the returned character byte-offset.

The <BREAK> key is masked from the user -- it will never be returned, since it is intercepted by the System. If a SETBRK routine is enabled, control passes to the processing program (see SETBRK) whenever <BREAK> is pressed. Otherwise, control will pass to TRSDOS-16 Ready.

Entry Conditions

Byte-offset	0-1	4
	6-7	<u>wait for character flag</u>

Exit Conditions

Byte-offset	2-3	<u>error code</u>
	6-7	<u>character present flag</u>
	8-9	<u>returned character</u>

If you want the SVC to return only when a character is detected, set the wait for character flag to non-zero. A zero in this byte-offset causes the SVC to return, with or without a character, immediately after the keyboard buffer is checked.

A character present flag of non-zero means the routine has returned with a valid ASCII character in the returned character position.

If it returns without a character, (when the SVC is set not to wait for a character) the routine clears the character present flag, but doesn't change the contents of the returned character byte-offset.

Example

This program returns the character most recently pressed and then calls PRINT CHARACTER ROUTINE, which uses either the VDCHAR or PRCHAR routines to print it.

```
      .  
      .  
KBCHAR  LDA      .A0,SVC BLOCK  
        MOVW     @A0,#KBCHAR SVC NUMBER  
        MOVW     6@A0,#WAIT FOR CHARACTER FLAG  
        BRK      #0  
        TESTW    2@A0  
        BNE      ERROR  
        CALL     PRINT CHARACTER ROUTINE  
      .  
      .  
SVC BLOCK  
      RDATA      32,0  
KBCHAR SVC NUMBER  
      EQU        4  
WAIT FOR CHARACTER FLAG  
      EQU        1
```

KBINIT
Keyboard Initialize

Function Code 1

Initializes the keyboard input driver. You might want to call this SVC before starting keyboard input to clear previous keystrokes and the key-ahead buffer. TRSDOS-16 does this automatically at start-up.

Entry Conditions

Byte-offset 0-1 1

Exit Conditions

Byte-offset 2-3 error code

Example

```

      .
      .
KBINIT  LDA      .A0,SVC BLOCK
        MOVW    @A0,#KBINIT SVC NUMBER
        BRK    #0
        TESTW  2@A0
        BNE    ERROR
      .
      .
SVC BLOCK  RDATA  32,0
KBINIT SVC NUMBER
        EQU    1

```

KBLINE
Keyboard Line

Function Code 5

Inputs a line from the keyboard to a buffer and echoes the line to the Display, starting at the current cursor position. As it receives and displays each character, the routine advances the cursor to the next position.

When you enter this routine, the input buffer contains a string of periods which it sends to the display. This string is for your convenience to indicate the length of the input field.

The keyboard line ends when you press <ENTER> or when the routine fills the input buffer. When you terminate line input, the routine always sends a carriage return and an erase-to-end-of-screen command to the Display. It stores a carriage return as a character input only if you actually press <ENTER>.

If you type a control code not listed below, the routine places it in the buffer and represents it on the display with the ± symbol.

KEY	HEX CODE	FUNCTION
BACKSPACE	08	Backspaces the cursor and erases a character.
ENTER	0D	Terminates line. Clears trailing periods on Display
CTRL W	17	Fills remainder of input buffer with blanks, blanks remainder of Display line
CTRL X	18	Fills remainder of input buffer with blanks, blanks to end of Display.
ESC	1B	Reinitializes input function by filling input buffer with periods and restoring cursor to original position.
<-	1C	Backspaces the cursor to allow editing of line. Does not erase characters.
->	1D	Advances the cursor to allow editing of line. Does not erase characters.

Entry Conditions

Byte-offset	0-1	5
	6-7	<u>maximum number of characters to receive (0 - 255)</u>
	8-11	<u>input buffer address</u>

Exit Conditions

Byte-offset	2-3	<u>error code</u>
	12-13	<u>actual number of characters input</u>
	14-15	<u>terminating character of input</u>
		H'0D if line was terminated with a carriage return, 0 if buffer was filled without a carriage return

Example

```

      .
      .
KBLINE  LDA      .A0,SVC BLOCK
        MOVW    @A0,#KBLINE SVC NUMBER
        MOVW    6@A0,#MAXIMUM INPUT COUNT
        LDA     .A1,KEYBD BUFFER
        STL     .A1,8@A0
        BRK     #0
        TESTW  2@A0
        BNE    ERROR
      .
      .
SVC BLOCK
      RDATA B 32,0
KBLINE SVC NUMBER
      EQU    5

      EQU    80
KEYBD BUFFER
      RDATA B 80,0

```

KILL
Delete File from Directory

Function Code 41

Deletes the specified file from the directory. A file must be closed for you to KILL it.

Entry Conditions

Byte-offset	0-1	41
	6-9	<u>filespec address</u>

Exit Conditions

Byte-offset	2-3	<u>error code</u>
-------------	-----	-------------------

The filespec address is the 32-bit address of a valid TRSDOS-16 filespec terminated by a carriage return.

Example

```

      .
      .
KILL  LDA      .A0,SVC BLOCK
      MOVW    @A0,#KILL SVC NUMBER
      LDA      .A1,FILE NAME
      STL     .A1,6@A0
      BRK     #0
      TESTW   2@A0
      BNE     ERROR
      .
      .
SVC BLOCK
      RDATA B 32,0
KILL SVC NUMBER
      EQUW   41
FILE NAME
      TEXT   'TEST/SRC'
      DATAB  H'0D

```

LOAD

Function Code 131

LOAD's a 68000 program into user memory.

Entry Conditions

Byte-offset	0-1	131
	6-9	<u>filespec address</u>
	10-13	<u>low bound address</u> (only if program is position independent, otherwise must be zero)
	14-17	<u>high bound address</u> (only if program is position independent, otherwise zero allows all of memory)

Exit Conditions

Byte-offset	2-3	<u>error code</u>
	10-13	<u>start load address</u>
	14-17	<u>address of last byte loaded</u>
	18-21	<u>transfer address</u>

Supply a low bounds address and high bounds address only if your program does NOT have any absolute memory references.

filespec address is the 32-bit address of a valid TRSDOS-16 program filespec terminated by a carriage return.

low bounds address is the logical address you want the program loaded at. Specifying zero means the entire user memory is available. If this number is non-zero then the program MUST be position-independent.

high bounds address is the logical address of the last byte available for the program being loaded. Specifying zero allows entire user memory.

start load address is the location in memory of the first byte loaded.

address of last byte loaded is the highest address of the loaded program.

transfer address is the program entry point (address of first instruction to be executed). If the program is nonexecutable ("load-only"), the byte-offset contains a -1.

Note: all addresses must be an even value.

Example

```
      .
      .
LOAD   LDA      .A0,SVC BLOCK
      MOVW     @A0,#LOAD SVC NUMBER
      LDA      .A1,FILE NAME
      STL      .A1,6@A0
      BRK      #0
      TESTW    2@A0
      BNE      ERROR
      .
      .
SVC BLOCK
      RDATA B 32,0
LOAD SVC NUMBER
      EQUW    131
FILE NAME
      TEXT    'TEST/SRC'
      DATAB   H'0D
```

LOCATE
Locate Record

Function Code 33

Returns the number of the current record, i.e., the last record accessed. You can call this routine only with FLR (fixed-length Record) files.

Entry Conditions

Byte-offset	0-1	33
	6-7	<u>file identification number</u>

Exit Conditions

Byte-offset	2-3	<u>error code</u>
	8-11	<u>record number</u>

The file identification number is a unique number assigned to each file when it is opened.

The record number is a 32 bit number specifying the desired record number. The record number will be zero if the file was just opened.

Example

Prior to execution of this routine, store the file identification number in register A1.

```

      .
      .
LOCATE  LDA      .A0,SVC BLOCK
        MOVW    @A0,#LOCATE SVC NUMBER
        STW     .A1,6@A0
        BRK     #0
        TESTW   2@A0
        BNE     ERROR
      .
      .
SVC BLOCK  RDATAB  32,0
LOCATE SVC NUMBER  EQUW  33

```

MOUNT
Mount Device

Function Code 138

Logically connects a device to the system. The system cannot access an unMOUNTed device. You must mount a diskette prior to any I/O attempts.

A DISMOUNT/MOUNT sequence is required for each floppy diskette swap.

You should make sure all files are closed before executing a DISMOUNT/MOUNT sequence.

Entry Conditions

Byte-offset	0-1	138
	6-9	<u>device name</u>

Exit Conditions

Byte-offset	2-3	<u>error code</u>
-------------	-----	-------------------

Valid device names are:

FD00	= floppy drive 0
FD01	= floppy drive 1
FD02	= floppy drive 2
FD03	= floppy drive 3
HD00	= hard drive 4
HD01	= hard drive 5
HD02	= hard drive 6
HD03	= hard drive 7

Example

```

      .
      .
MOUNT LDA      .A0,SVC BLOCK
      MOVW     @A0,#MOUNT SVC NUMBER
      LDA      .A1,DEVICE NAME
      MOVL     6@A0,@A1
      BRK      #0
      TESTW   2@A0
      BNE      ERROR
      .
      .

```

SVC BLOCK		
	RDATAB	32,0
MOUNT SVC NUMBER		
	EQUW	138
DEVICE NAME		
	TEXT	'FD01'

MOVBUF
Move Buffer

Function Code 267

Either retrieves or stores an 80-byte buffer outside the user's memory. This buffer serves two purposes:

1. To pass parameters when chaining two machine language programs.

(When chaining programs, do not use DOSCMD to execute the programs. Use EXECUT instead.)

2. To retrieve a TRSDOS-16 command line. When TRSDOS-16 starts a user program, it stores the command line that invoked the job in this area.

(When TRSDOS-16 stores a command line it terminates it with a carriage-return character. However, when MOVBUF retrieves a command line 80 characters long, it does not retrieve the carriage return, implied 81st character.)

There are two ways to alter this buffer:

1. A MOVBUF request from memory to buffer overwrites anything in the buffer. Note that 80 bytes (50 Hex bytes) are always moved.
2. A DOSCMD request does an implied move into the buffer before executing the request. Anything previously stored in the buffer is lost.

Entry Conditions

Byte-offset	0-1	267
	6-9	<u>user buffer address</u>
	10-11	<u>switch</u>
		0 = Retrieve
		non-zero = Store

Exit Conditions

Byte-offset	2-3	<u>error code</u>
-------------	-----	-------------------

Example

```
MOVBUF   LDA      .A0,SVC BLOCK
          MOVW    @A0,#MOVBUF SVC NUMBER
          LDA     .A1,BUFFER
          STL     .A1,6@A0
          MOVW    10@A0,#FETCH SWITCH
          BRK     #0
          TESTW  2@A0
          BNE    ERROR
          .
          .
SVC BLOCK RDATAB   32,0
MOVBUF SVC NUMBER EQUW   267
BUFFER   RDATAB   80,0
FETCH SWITCH EQUW   0
```

OPEN
Open File

Function Code 40

Creates new files and opens existing files.

Once a given file has been opened, OPEN assigns a unique file identification number to the file. This number is used in all other file processing SVC's to designate that specific file.

Entry Conditions

Byte-offset	0-1	40
	6-9	<u>filespec address</u>
	10-13	<u>parameter list address</u>

Exit Conditions

Byte-offset	2-3	<u>error code</u>
	14-15	<u>file identification number</u>

The filespec address is the 32-bit address of a valid TRSDOS-16 filespec terminated by a carriage return.

The parameter list address is the address of a 5-bytes field (0-4) which contains:

Byte	Contents
00	<u>access code</u> "R" Read access to the file "W" Read/Write (data files) "P" Read/Write access to Z80 program files
01	<u>record length</u> in bytes
02	<u>file type</u> "F" fixed "V" variable
03	<u>creation code</u> (0-3 -- see table)
04	<u>user attribute byte</u>

The creation code specifies the way TRSDOS-16 opens the file:

Code	Function
Ø	Open the file only if it already exists. Do not create a new file. The <u>record length</u> and end of file pointers are not reset. Exclusive access only.
1	Creates a new file. Does not open an existing file (returns an error if a file of the same name already exists on the specified drive). Resets the <u>record length</u> and end of file. Exclusive access only.
2	Open a new file. If a file of the same name already exists, overwrite it. Resets <u>record length</u> and end of file. Exclusive access only.
3	Opens an existing file for shared access. The file MUST already exist (same as mode Ø).

The user attribute byte allows you to give your own identification number to certain types of data files

You can use Ø or any number from 32 - 255 for this value.

TRSDOS-16 will not examine this user attribute; it is solely for your convenience.

You can assign this user attribute only to files you open with a creation code of 1 or 2. Files opened with a creation code of Ø or 3 will retain the file's previously assigned user attribute. All files created with the CREATE command will have a user attribute value of zero.

The file identification number is a unique number assigned to each file when it is opened.

Example

```

      .
      .
OPEN   LDA      .A0,SVC BLOCK
      MOVW     @A0,#OPEN SVC NUMBER
      LDA      .A1,FILE NAME
      STL      .A1,6@A0

OPENDO
Open DO File

Function Code 140

Creates a special file or opens an existing one.

OPENDO opens a special file that will not be closed by returning to TRSDOS-16 Ready or executing the CLOSEF SVC.

OPENDO is useful for chaining programs.

Once a given file has been opened, OPENDO assigns a unique file identification number to the file. This number is used in all other file processing SVC's to designate that specific file.

Only one file may be opened with OPENDO at a time. Therefore, this call cannot be made if a DO file is active.

Entry Conditions

Byte-offset	0-1	140
	6-9	<u>filespec address</u>
	10-13	<u>parameter list address</u>

Exit Conditions

Byte-offset	2-3	<u>error code</u>
	14-15	<u>file identification number</u>

The filespec address is the 32-bit address of a valid TRSDOS-16 filespec terminated by a carriage return.

The parameter list address is the address of a 5-bytes field (0-4) which contains:

Byte	Contents
-----	-----
00	<u>access code</u>
	"R" Read access to the file
	"W" Read/Write (data files)
	"P" Read/Write access to Z80 program files

Byte	Contents
Ø1	<u>record length</u> in bytes
Ø2	<u>file type</u> "F" fixed "V" variable
Ø3	<u>creation code</u> (Ø-3 -- see table)
Ø4	<u>user attribute byte</u>

The creation code specifies the way TRSDOS-16 opens the file:

Code	Function
Ø	Open the file only if it already exists. Do not create a new file. The <u>record length</u> and end of file pointers are not reset. Exclusive access only.
1	Creates a new file. Does not open an existing file (returns an error if a file of the same name already exists on the specified drive). Resets the <u>record length</u> and end of file. Exclusive access only.
2	Open a new file. If a file of the same name already exists, overwrite it. Resets <u>record length</u> and end of file. Exclusive access only.
3	Opens an existing file for shared access. The file MUST already exist (same as mode Ø).

The user attribute byte allows you to give your own identification number to certain types of data files.

You can use Ø or any number from 32 - 255 for this value.

TRSDOS-16 will not examine this user attribute; it is solely for your convenience.

You can assign this user attribute only to files you open with a creation code of 1 or 2. Files opened with a

creation code of 0 or 3 will retain the file's previously assigned user attribute. All files created with the CREATE command will have a user attribute value of zero.

The file identification number is a unique number assigned to each file when it is opened.

Example

```

      .
      .

```

PRCHAR
Print Character

Function Code 18

Sends one character to the Printer's buffer.

Note: Most printers don't print until their buffer is filled or until they receive a carriage return. (See your printer's manual for information.)

Normally, TRSDOS-16 intercepts certain codes and does not send them directly to the printer. There are several ways to override some or all of these character translations. See PRINIT and PRCTRL SVCs.

While the serial printer option is selected, allowing printer output to Channel B, two INPUT characters are recognized from Channel B. These will affect all serial printer output operations:

ASCII Name	Hex Code	Result
DC3, "CTRL-S"	13	Pause Printing
DC1, "CTRL-Q"	11	Resume Printing

INTERCEPTED CODES

ASCII NAME	HEX CODE	RESULT TO PRINTER
Tab	09	From one to eight spaces are sent to provide a tab function.
Vertical Tab	0B	Same as form feed below.
Form Feed	0C	TRSDOS-16 sends enough carriage returns or line feeds to the printer to advance the paper to the next top of form.

ASCII NAME	HEX CODE	RESULT TO PRINTER
Carriage Return	0D	When the current line is empty, (no characters printed since the last carriage return or line feed), TRSDOS-16 translates this as a line feed to allow correct operation of Radio Shack printers. In the auto line feed mode, H'0A' is sent after every H'0D'.
Special	8D	TRSDOS-16 sends a carriage return to the printer. In the auto line feed mode, using this code allows you to send a carriage return without a line feed.

Entry Conditions

Byte-offset 0-1 18
 6-7 character to output

Exit Conditions

Byte-offset 2-3 error code

Example

Before executing this program, load register A1 with the character from byte-offset 8 of the KBCHAR SVC routine.

```

      .
      .
PRCHAR  LDW      .A1,8@A0
        LDA      .A0,SVC BLOCK
        MOVW     @A0,#PRCHAR SVC NUMBER
        STW      .A1,6@A0
        BRK      #0
        TESTW    2@A0
        BNE      ERROR
      .
      .
SVC BLOCK
        RDATA    32,0
PRCHAR SVC NUMBER
        EQU     18
  
```

PRCTRL
Control Printer Operation

Function Code 95

Provides you with various printer options and lets you check the status of printer-related functions.

If you are using the spooler's capture function, the captured data is sent directly to the capture-file -- regardless of what control settings are selected. If you are using the spooler's background printing function, the printed data is interpreted according to the currently selected control settings. See SPOOL for details.

You can operate with two printers, by switching between the serial and parallel output modes. One printer can use the automatic control features of TRSDOS (auto form feed, etc.), while the other printer is controlled by the program. This is necessary since only one set of control counters is maintained.

Entry Conditions

Byte-offset	0-1	95
	6-7	<u>option code</u> (See Table 2)
	8-9	<u>option value</u> (applicable only with option codes 3 and 4)

Exit Conditions

Byte-offset	2-3	<u>error code</u>
	10-11	<u>physical page length</u>
	12-13	<u>logical page length</u>
	14-15	<u>logical line length</u>
	16-17	<u>number of characters printed on present line</u>
	18-19	<u>number of lines on present page</u>

The option code is a 16-bit value used to select the print control option you wish.

The option value is used by option codes 3 and 4 which allow you to reset the current line count or the current character count. Put the new values in this byte-offset.

Available option codes are:

CODE	OPTION
∅	Get printer status only (see Exit Conditions)
1	Select serial printer driver (you must initialize channel B first)
2	Select parallel printer driver
3	Reset current line count to the value contained in <u>option value</u> *
4	Reset current character count on current line to value contained in <u>option value</u> *
5	Begin transparent mode *
6	End transparent mode *
7	Begin dummy mode *
8	End dummy mode *
9	Begin auto line-feed after carriage return
1∅	End auto line-feed after carriage return

* EXPLANATION OF OPTIONS

EXPLANATION OF OPTIONS

Serial/Parallel Printer Option

While the serial printer option is selected, allowing printer output to Channel B, two INPUT characters are recognized from Channel B. These will affect all serial printer output operations:

ASCII Name	Hex Code	Result
DC3, "CTRL-S"	13	Pause Printing
DC1, "CTRL-Q"	11	Resume Printing

Line count/Character count

TRSDOS-16 maintains a single line counter and a single character counter.

Transparent Mode

The transparent mode overrides all data translation. All data bytes go directly to the printer; TRSDOS-16 does not examine the contents or update the line and character counts.

Normally, TRSDOS-16 "intercepts" certain control characters and interprets them. In this way, TRSDOS-16 provides printer-related features which may not be available from the printer

For example, tabs (H'09') are intercepted so that TRSDOS-16 can send the appropriate number of spaces to provide the tab function. Form feeds (H'0C' or H'0B') are intercepted so that TRSDOS-16 may advance the paper to the top of the next form.

Special settings of the printer initialization values can override individual code translation. See SVC PRINIT for details.

Dummy Output Mode

The dummy mode "throws away" all printer output and returns with a "good" (Z flag set) return code. During dummy mode operation, the line count and character count remain unchanged.

Auto Line Feed

Normally, the TRSDOS-16 printer driver doesn't output line feeds after carriage returns because most Radio Shack printers do an automatic line-feed after every carriage return.

If your printer does not perform automatic line-feeds after carriage returns, you may enable the TRSDOS-16 auto line-feed function.

While the function is enabled, TRSDOS-16 outputs a line-feed after each carriage return. This is true in all modes, including the transparent mode.

Note: In the auto line-feed mode, you can send a carriage return with no line-feed by outputting the code H'8D'. If the printer can overprint, this code returns the carriage without advancing the paper.

PRECEDENCE OF OPTIONS

The priority of the available options are (in descending order):

Dummy Mode
 Auto Line-Feed after Carriage Return
 Transparent Mode
 Normal Mode

Example

```

      .
      .
PRCTRL LDA      .A0,SVC BLOCK
        MOVW    @A0,#PRCTRL SVC NUMBER
        MOVW    6@A0,#GET STATUS OPTION
        BRK     #0
        TESTW   2@A0
        BNE     ERROR
      .
      .
SVC BLOCK
      RDATA B 32,0
PRCTRL SVC NUMBER
      EQU     95
GET STATUS OPTION
      EQU     0
  
```

PRINT
Printer Initialization

Function Code 17

Initializes the printer driver.

It does **not** advance the printer paper and does **not** check printer status or availability. It will operate even if the printer is offline.

Entry Conditions

Byte-offset	0-1	17
	6-7	<u>physical page length</u>
	8-9	<u>logical page length</u>
	10-11	<u>logical line length</u>

Exit Conditions

Byte-offset	2-3	<u>error code</u>
-------------	-----	-------------------

physical page length is the number of lines that can be printed on one page. It is normally 66.

logical page length is the number of lines you want printed on each page. It must be less than physical page length. After that number of lines has been printed, (logical page length < physical page length) TRSDOS-16 will send a top-of-page request to the printer (form feed).

logical line length is the maximum number of characters to be printed on each line. Once that number has been reached, the line will be printed and a new line is begun (wrap-around).

Notes:

1. If logical page length and physical page length are equal and non-zero, TRSDOS-16 will not do an end-of-page skip. It will translate form feed into the correct number of line feeds necessary to get to the top of the next page.

2. If either logical page length or physical page length are zero, the other **must** also be zero. When both are equal to zero, form feeds (H'ØC) and vertical tabs (H'ØB) are not translated into line feeds, but are sent directly to the printer.
3. If logical line length is zero, then tab characters (H'Ø9) will not be translated into spaces, but sent directly to the printer. TRSDOS-16 will still maintain an internal character count, with tabs counting as one character.
4. On Exit, current character count and line-in-page count are reset to zero.
5. TRSDOS-16 assumes the printer is at top-of-page when this SVC is executed.
6. DUMMY and TRANSPARENT modes are reset to NORMAL. AUTO-LINEFEED and DUAL options are unaffected by this SVC. (See PRCTRL)
7. When the system is powered-up or reset, the following defaults are assumed:

physical page length	==	66
logical page length	==	6Ø
logical line length	==	132

The other options selected during initialization are:

Auto-Line Feed	=	off
Dummy Mode	=	off
Transparent Mode	==	off

Example

```

PRINIT  LDA      .AØ,SVC BLOCK
        MOVW    @AØ,#PRINIT SVC NUMBER
        MOVW    6@AØ,#PHY PAGE LENGTH
        MOVW    8@AØ,#LOG PAGE LENGTH
        MOVW    1Ø@AØ,#LOG LINE LENGTH

```

EQU	30
LOG LINE LENGTH	
EQU	45

PRLINE
Print Line

Function Code 19

Sends a line of characters to the printer's buffer. The line can include control characters as well as printable data.

See PRCHAR for a listing of intercepted codes.

Entry Conditions

Byte-offset	0-1	19
	6-7	<u>length of line (0-255)</u>
	8-9	<u>terminator character to send after last character in buffer</u>
	10-13	<u>address of buffer</u>

Exit Conditions

Byte-offset	2-3	<u>error code</u>
-------------	-----	-------------------

Example

In this example, TRSDOS-16 retrieves the length of line, terminator character, and address of buffer from the KBLINE SVC routine.

```

      .
      .
      LDW      .A1,12@A0  *Get length of line
      LDW      .A2,14@A0  *Get terminator character
      LDA      .A3,KEYBD BUFFER  *Get buffer address
PRLINE LDA      .A0,SVC BLOCK
      MOVW    @A0,#PRLINE SVC NUMBER

```

SVC BLOCK
RDATA B 32,Ø
PRLINE SVC NUMBER
EQUW 19

READNX
Read Next Record

Function Code 34

Reads the next record after the current record (the last record accessed). If you have just opened the file, READNX reads the first record.

Entry Conditions

Byte-offset	0-1	34
	6-7	<u>file identification number</u>
	8-11	<u>record buffer address</u>
	12-13	<u>record lock flag</u>

Exit Conditions

Byte-offset	2-3	<u>error code</u>
-------------	-----	-------------------

The file identification number is a unique number assigned to each file when it is opened.

The record buffer address is a 32-bit address that points to the beginning of a 256-byte Record Buffer; that is where the record will be placed after the disk read.

If the record lock flag is non-zero, the specified record remains locked until the user program performs an UNLOCK on the record.

If the record lock flag is zero, the record is not locked.

Example

Prior to this routine, store the file identification number in register A1.

```

      .
      .
READNX  LDA      .A0,SVC BLOCK
        MOVW    @A0,#READNX SVC NUMBER
        STW     .A1,6@A0
        LDA     .A2,RECORD BUFFER AREA
        STL     .A2,8@A0

```

RENAME
Rename File

Function Code 47

Changes the name and/or extension of a file.

This SVC cannot change the password. If the old filespec is password protected, you must specify the password and the new filespec retains the same password.

The new filespec can't refer to an existing file.

Entry Conditions

Byte-offset	0-1	47
	6-9	<u>old filespec address</u>
	10-13	<u>new filespec address</u>

Exit Conditions

Byte-offset	2-3	<u>error code</u>
-------------	-----	-------------------

The filespec address is the 32-bit address of a valid TRSDOS-16 filespec terminated by a carriage return.

Example

```

      .
      .
RENAME LDA      .A0,SVC BLOCK
        MOVW    @A0,#RENAME SVC NUMBER
        LDA     .A1,OLD NAME
        STL     .A1,6@A0
        LDA     .A1,NEW NAME
        STL     .A1,10@A0
        BRK    #0
        TESTW  2@A0

RESET
Reset Memory

Function Code 129

It is the same as pressing the RESET switch.

Reset will not close an OPENDO file.

Entry Conditions

Byte-offset	0-1	256
	6-7	00 (Reserved)

Exit Conditions

Byte-offset	2-3	<u>error code</u>
-------------	-----	-------------------

Example

```

      .
      .
RESET  LDA      .A0,SVC BLOCK
        MOVW    @A0,#RESET SVC NUMBER
        MOVW    6@A0,#00
        BRK     #0
      .
      .
SVC BLOCK  RDATA B 32,0
RESET SVC NUMBER EQU 129

```

RS232C

Function Code 55

Initialize RS-232-C Channel

Sets up or disables either channel A or B.

This routine sets the standard RS-232C parameters, and defines a pair of supervisor calls for I/O to the specified channel. When you initialize Channel A, SVC's 96, 97, 100 are defined; when you initialize Channel B, SVC's 98, 99, and 101 are defined. See ARCV, ATX, BRCV, BTX, ACTL and BCTL.

Entry Conditions

Byte-offset	0-1	55
	6-7	<u>option value</u>
		0 = deactivate
		non-zero = activate
	8-11	<u>parameter list address</u>

Exit Conditions

Byte-offset	2-3	<u>error code</u>
-------------	-----	-------------------

Set the option value to 0 to deactivate the serial channel. Any non-zero value activates the channel. You must always deactivate the channel (turn it off) before you set the parameters.

The parameter list address is the address of a 6-byte field (0-5) which contains:

Byte	Contents
00	Channel code 'A' or 'B' (ASCII)
01	Baud Rate:
	1 = 100 baud
	2 = 150 baud
	3 = 300 baud
	4 = 600 baud
	5 = 1200 baud
	6 = 2400 baud
	7 = 4800 baud
	8 = 9600 baud

Byte	Contents
	Some applications do not run well at the higher baud rates.
02	Data Word Length (5 - 8 bits)
03	Parity 'E' (even), 'O' (odd), or 'N' (none)
04	Number of stop bits (1 or 2)
05	End of list marker (binary 0)

Example

```

      .
      .

SETBRK
Set <BREAK>

Function Code 269

Lets you enable the <BREAK> key by defining a <BREAK>-key processing program.

Whenever the <BREAK> key is pressed, your processing program takes over. On entry to the <BREAK> processing program, the return address of the interrupted routine is on the User Stack and can be returned to with an RTR instruction (return with restore).

See 'PROGRAMMING WITH USER INTERRUPTS' for further information.

Entry Conditions

Byte-offset	0-1	269
	6-7	<u>switch</u>
		0 = Off (normal TRSDOS-16 break processing)
		1 = On (user programmed break processing)
		2 = Disable (TRSDOS-16 ignores <BREAK> key completely)
	8-11	<u>transfer address</u>
		0 = Fetch
		non-zero = Store

Exit Conditions

Byte-offset	2-3	<u>error code</u>
-------------	-----	-------------------

The transfer address is the address you want to jump to when the <BREAK> key is pressed. It must be even.

Example

```

      .
      .
SETBRK LD0      .A0,SVC BLOCK
        MOVW    @A0,#SETBRK SVC NUMBER

SETTRP
Sets a Trap Vector

Function Code 266

Allows you to set or remove a trap vector. When a BRK is executed (either through the BRK-BRKV instructions or an error trap) control goes to the address specified by the user. See SETBRK and PROGRAMMING WITH USER INTERRUPTS for further information on interrupts.

Entry Conditions

Byte-offset	0-1	266
	6-7	<u>function code</u>
	8-9	<u>vector number</u>
	10-13	<u>vector address</u>

Exit Conditions

Byte-offset	2-3	<u>error code</u>
	14-17	<u>previous vector address</u>

The function codes are:

- 0 - Install (SET) trap
- 1 - Remove trap
- 2 - Remove all traps (except BRK 0)

The available vector numbers are:

Vector #	Assignment
1 - 15	Trap vectors 1-15
16	Illegal Instruction
17	Zero Divide
18	CHK Instruction
19	TRAPV Instruction
20	Privilege Violation
21	Line 1010 Emulator
22	Line 1111 Emulator
23	Access out of Partition
24	Odd Address Error

Note that BRK 0 is reserved for implementation of supervisor calls.

The Emulators (Vectors 21 and 22) are illegal opcodes which can be trapped. These are opcodes that have an 'A' or 'F' in the first nybble (high order 4 bits). That is Axxx or Fxxx as an opcode.

The vector address is the address to jump to when the trap is executed. It must be even.

Example

```

      .
      .
SETTRP  LDA      .A0,SVC BLOCK
        MOVW    @A0,#SETTRP SVC NUMBER
        MOVW    6@A0,#SET TRAP FUNCTION
        MOVW    8@A0,#TRAP 16
        MOVL    10@A0,#TRAP 16 ADDRESS
        BRK     #0
        TESTW   2@A0
        BNE     ERROR
      .
      .
SVC BLOCK  RDATA  32,0
SETTRP SVC NUMBER  EQUW  266
SET TRAP FUNCTION  EQUW  0
TRAP 16           EQUW  16
TRAP 16 ADDRESS  EQUW  H'5000
                EQUW  H'5000

```

UNLOCK
Unlock Record

Function Code 136

Unlocks a specified record number, or all records within a specified file, that you previously locked.

See READNX or DIRRD for information on how to lock a record.

Entry Conditions

Byte-offset	0-1	136
	6-7	<u>file identification number</u>
	8-9	<u>record number</u>

Exit Conditions

Byte-offset	2-3	<u>error code</u>
-------------	-----	-------------------

The record number contains the logical record number of the file to be UNLOCKed. Specifying a -1 in the record number byte-offset UNLOCKS all the records in the file which are locked by the calling user.

The file identification number is a unique number assigned to each file when it is opened.

Example

Before executing this program, store the file identification number in register A1.

```

      .
      .
UNLOCK LDA      .A0,SVC BLOCK
      MOVW     @A0,#UNLOCK SVC NUMBER
      STW      .A1,6@A0
      MOVW     8@A0,#UNLOCK ALL RECORDS
      BRK      #0
      TESTW    2@A0
      BNE      ERROR
      .
      .
      .

```

SVC BLOCK	
RDATA	32,0
UNLOCK SVC NUMBER	
EQU	136
UNLOCK ALL RECORDS	
EQU	-1

VDCHAR
Video Character

Function Code 8

Outputs a character to the display at the current cursor position.

TRSDOS-16 ignores the control codes not listed in the following chart.

KEY	HEX CODE	FUNCTION
F1	01	Blinking cursor on.
F2	02	Cursor off.
CTRL D	04	Turns on steady cursor.
BACKSPACE	08	Moves cursor back one position and blanks the character at that position.
TAB	09	Advances cursor to next tab position. Tab positions are at 8-character boundaries, 8, 16, 24, 32,
CTRL J	0A	Line feed--cursor moves down to next row, same column position.
CTRL K	0B	Positions cursor to beginning of previous line.
ENTER	0D	Moves cursor down to beginning of next line.
CTRL N	0E	Turns dual routing on.
CTRL O	0F	Turns dual routing off.
CTRL T	14	Homes cursor (upper left corner)
CTRL W	17	Erases to end of line, cursor doesn't move
CTRL X	18	Erases to end of screen, cursor doesn't move.
CTRL Y	19	Sets Normal Display mode (white on black). Remains Normal until reset by programmer.
CTRL Z	1A	Sets Reverse Display mode (black on white). Remains Reverse until reset by programmer.
ESC	1B	Erases screen and homes cursor (position 0).
left arrow	1C	Moves cursor back one position.
right arrow	1D	Moves cursor forward one position.
up arrow	1E	Sets 80 character line and clears Display.
down arrow	1F	Sets 40 character line and clears Display.

Entry Conditions

Byte-offset	0-1	8
	6-7	<u>character to output</u> (0-127)

Exit Conditions

Byte-offset	2-3	<u>error code</u>
-------------	-----	-------------------

Example

This routine clears the screen.

```

      .
      .
VDCHAR  LDA      .A0,SVC BLOCK
        MOVW    @A0,#VDCHAR SVC NUMBER
        MOVW    6@A0,#CLS
        BRK     #0
        TESTW  2@A0
        BNE    ERROR
      .
      .
SVC BLOCK  RDATA  32,0
VDCHAR SVC NUMBER  EQUW  8
CLS       EQUW    H'1E

```

VDINIT
Video Initialization

Function Code 7

You might want to call this routine before starting any I/O to the Video Display. It blanks the screen and homes the cursor (moves the cursor to the upper left corner of the video display).

Entry Conditions

Byte-offset	0-1	7
	6-7	<u>character size switch</u>
		0 = 40 characters/line
		non-zero = 80 characters/line
	8-9	<u>normal/reverse switch</u>
		0 = reverse mode (black on green/ black on white)
		non-zero = normal mode (green on black/white on black)

Exit Conditions

Byte-offset	2-3	<u>error code</u>
-------------	-----	-------------------

Example

```

      .
      .
VDINIT  LDA      .A0,SVC BLOCK
        MOVW    @A0,#VDINIT SVC NUMBER
        MOVW    6@A0,#CHAR80
        MOVW    8@A0,#NORMAL
        BRK     #0
        TESTW   2@A0
        BNE    ERROR
      .
      .
SVC BLOCK  RDATA  32,0
VCINIT SVC NUMBER
        EQU    7
    
```

CHAR8Ø	EQUW	1
NORMAL	EQUW	1

VDLINE
Video Line

Function Code 9

Writes a specified text buffer to the display, starting at the current cursor position. The text buffer must contain codes less than H'80.

Entry Conditions

Byte-offset	0-1	9
	6-7	<u>buffer size</u> (0 - 255)
	8-9	<u>terminator character to be sent after the buffer text</u>
	10-13	<u>buffer address</u>

Exit Conditions

Byte-offset	2-3	<u>error code</u>
	14-15	<u>on error</u> (number of characters not sent)
	16-17	<u>on error</u> (character causing error)

The buffer pointed to by the buffer address should contain ASCII codes in the range 0 to 127.

This routine handles control codes in the buffer in the same manner as in the VDCHAR routine.

Example

This example retrieves the buffer size, terminator character, and buffer Address from the KBLINE SVC routine.

```

      .
      .
      LDW      .A1,12@A0  *Get length of input line
      LDW      .A2,14@A0  *Get terminator character
      LDA      .A3,KEYBD BUFFER  *Get address of buffer
VDLINE LDA      .A0,SVC BLOCK
      MOVW     @A0,#VDLINE SVC NUMBER
      STW      .A1,6@A0
      STW      .A2,8@A0
      STL      .A3,10@A0

```

	BRK	#0
	TESTW	2@A0
	BNE	ERROR
	:	
SVC BLOCK		
	RDATAB	32,0
VDLINE SVC NUMBER		
	EQUW	9

VERSION
Get Version of Operating System

Function Code 137

Determines the version of software currently servicing 68000 requests.

Entry Conditions

Byte-offset 0-1 137

Exit Conditions

Byte-offset	2-3	<u>error code</u>
	6-7	<u>major version level</u>
	8-9	<u>minor version level</u>
	10-11	<u>patch level</u>

The major version level is the integral portion of the version number printed during startup.

The minor version level is the fractional portion of this quantity.

The patch level is any level following the version number.

For example, version 2.0a returns major version level 2, minor version level 0, and patch level 'a'.

Example

```

      .
      .
VERSION  LDA      .A0,SVC BLOCK
          MOVW    @A0,#VERSION SVC NUMBER
          BRK     #0
          TESTW   2@A0
          BNE     ERROR
          .
          .
SVC BLOCK
          RDATAB  32,0
VERSION SVC NUMBER
          EQU     137

```

VIDKEY
Video Key

Function Code 12

This routine combines the functions of VDLINE and KBLINE.

It writes a buffer of data to the display, starting at the current cursor position, then waits for a line from the keyboard.

Once the text message has been displayed, the cursor will be positioned immediately after the last character displayed. To move it to another position, a control code can be placed at the end of the text buffer.

VIDKEY then uses KBLINE to get a line from the keyboard. Note that before starting the line input, all previously stored keystrokes are cleared.

Refer to KBCHAR and VDCHAR for a list of control codes and other details.

Entry Conditions

Byte-offset	0-1	12
	6-7	<u>number of characters to be displayed (0-255)</u>
	8-9	<u>length of keyboard input field (0-255)</u>
	10-13	<u>address of keyboard input buffer</u>
	14-17	<u>address of display text buffer</u>

Exit Conditions

Byte-offset	2-3	<u>error code</u>
	18-19	<u>on error</u> (number of characters not sent)
	20-21	<u>on error</u> (character causing error)

Example

```

      .
VIDKEY  LDA      .A0,SVC BLOCK
        MOVW    @A0,#VIDKEY SVC NUMBER
        MOVW    6@A0,#DISPLAY COUNT
        MOVW    8@A0,#INPUT COUNT
        LDA     .A1,KEYBD BUFFER
        STL     .A1,10@A0
        LDA     .A1,MESSAGE PROMPT
        STL     .A1,14@A0
        BRK    #0
        TESTW  2@A0
        BNE    ERROR
      .
SVC BLOCK
      RDATA B 32,0
VIDKEY NUMBER
      EQU    12
DISPLAY COUNT
      EQU    21
MESSAGE PROMPT
      TEXT  'ENTER THE ANSWER HERE'
INPUT COUNT
      EQU    20
KEYBD BUFFER
      RDATA B 20,0

```

WRITNX
Write Next Record

Function Code 43

Writes the next record after the last record accessed; i.e., this routine writes records sequentially.

If WRITNX is the first access after opening the file, it writes the first record.

Entry Conditions

Byte-offset	0-1	43
	6-7	<u>file identification number</u>
	8-11	<u>record buffer address</u>

Exit Conditions

Byte-offset	2-3	<u>error code</u>
-------------	-----	-------------------

The file identification number is a unique number assigned to each file when it is opened.

The record buffer address is a 32-bit address that points to the beginning of a 256-byte Record Buffer; that is where the record will be placed after the disk read.

Example

Store the File Identification Number in register A1 before executing this routine.

```

      .
      .
WRITNX LDA      .A0,SVC BLOCK
      MOVW     @A0,#WRITNX SVC NUMBER
      STW      .A1,6@A0
      LDA      .A2,RECORD BUFFER AREA
      STL      .A2,8@A0
      BRK      #0
      TESTW    2@A0
      BNE      ERROR
      .
      .

```

SVC BLOCK		
	RDATAB	32,Ø
WRITNX SVC NUMBER		
	EQUW	43
RECORD BUFFER AREA		
	RDATAB	256,Ø

APPENDICES

APPENDIX A / Error Messages

There are three kinds of error messages you might get while using your Computer:

- . Boot Errors, such as "BOOT ERROR DC." See the BOOT ERRORS TABLE for more information.
- . Operating System Errors, such as "ERROR 24" or "FILE NOT FOUND." To get a brief description of a numbered error, type "ERROR" followed by the error number displayed. For example, type:

```
ERROR 31 <ENTER>
```

and your screen will show:

```
PROGRAM NOT FOUND
```

For more information, see the SYSTEM ERRORS TABLE.

- . Application Program Errors -- see your application program manual.

When an error message is displayed:

- . Try the operation several times.
- . Look up boot errors and operating system errors in the following tables and take the recommended actions. See your application program manual for explanations of application program errors.
- . Try using other diskettes.
- . Reset the Computer and try the operation again.
- . Check all the power connections.
- . Check all interconnections.
- . Remove all diskettes from drives, turn off the Computer, wait 15 seconds, and turn it on again.
- . If you try all these remedies and still get an error message, contact a Radio Shack Service Center.

Note: If there is more than one thing wrong, the Computer might wait until you correct the first error before displaying the second error message.

RSSC = Radio Shack Service Center

SYSTEM ERRORS TABLE

Error Code	Description	Explanation/Action
6	Attempt to open a file which hasn't been closed.	Close file before re-opening.
28	Attempt to read past end of file.	Record Number specified is past the EOF.
34	Attempt to use a non program file as a program.	File specified for execution is not a program file or an illegal load address was given.
133	Bad CRT number.	For multi-user only.
1	Bad function code on SVC call or no function exists.	Check function code number used on an SVC call.
132	Bad partition number.	For multi-user only.
129	Bad SVC-Block format.	Check format of SVC-block for errors.
	BOOT ERROR	See BOOT ERROR TABLE
4	CRC error during disk I/O (input/output) operation.	Try operation again, using a different diskette. If problem occurs frequently call RSSC.
2	Character not available.	No record or character was available when the SVC was called.
16	DCB is modified and is unusable.	DCB (used in machine-language programming) has been modified since last disk access (while the file was open).

Error Code	Description	Explanation/Action
41	Data lost during disk I/O (input/output). Hardware fault.	Contact a Radio Shack Service Center.
135	Debug Not Configured.	Include Debug at configuration time.
136	Device not available.	Device already assigned For multi-user only.
137	Device Unassigned.	For multi-user only.
17	Directory read error.	Error occurred while trying to read directory. Use a different diskette.
26	Directory space full.	Number of filenames exceed the amount set when diskette was formatted.
18	Directory write error.	Error occurred while trying to write to the directory. Use a different diskette.
33	Disk space allocation can't be made because of fragmentation of space. (not used on TRSDOS-II)	Use a different diskette or copy files to a clean diskette to reduce fragmentation.
27	Disk space full.	No available space on diskette.
8	Disk drive not ready.	Drive door open or diskette not in drive. On thinline drives, use TRSDOS-II, TRSDOS-16, or patched version of TRSDOS 2.0b.

Error Code	Description	Explanation/Action
15	Disk is write protected.	Use a diskette with a write-enable tab on it.
5	Disk sector not found.	Try a different diskette.
128	DO-Nesting not allowed.	A 'DO' command was encountered within a DO file.
25	File access denied due to password protection.	Incorrect password given for protection level -- See ATTRIB in the Model 16 Owner's Manual.
11	File already in directory.	Filename already exists as a directory entry. Kill existing file or choose another filename.
24	File not found.	Filename given not found on available diskettes or file is incorrect type for desired operation.
49	Hardware fault during disk I/O (input/output).	Contact a Radio Shack Service Center.
38	I/O (input/output) attempt to an unopen file.	Open file before access.
39	Illegal I/O (input/output) attempt.	On Thinline drives -- use patched version of TRSDOS. Can be caused by an I/O attempt to a differently formatted diskette. Format diskette under current version of TRSDOS or use FCOPY.

Error Code	Description	Explanation/Action
131	Illegal Address.	SVC block or SVC argument is not within the memory range.
138	Illegal device name.	Device name specified for ASSIGN not valid.
7	Illegal disk change.	The system detected an illegal disk swap.
144	Illegal File Type	File type used is not the type required by the system (VLR or FLR).
134	Illegal operation	For multi-user only.
19	Improper file name (filespec).	Filespec given does not meet TRSDOS standard file specifications.
48	Incorrect command parameter.	Option or argument given in command is incorrect.
9	Invalid data provided by caller.	Data stream to be processed has illegal characters.
50	Invalid Space Descriptor.	Try a different diskette.
10	Maximum of 16 files may be open at once.	Too many files opened at one time.
35	Memory fault during program load.	Program not loaded correctly, possibly because of faulty memory or because a bad load address was given.
12	No drive available for an open.	No on-line drive is: a) write enabled or b) has enough space to create a new file.

Error Code	Description	Explanation/Action
∅	No error found.	No error occurred.
3∅	No more extents available (16 maximum). (not used on TRSDOS-II)	Data on diskette too fragmented, copy files to a clean diskette.
46	Not applicable to VLR type files.	Operation performed not valid for VLR files.
2∅	Not Used.	
21	Not Used.	
22	Not Used.	
23	Not Used.	
13∅	Odd address.	Address required by SVC block must be even.
37	Open attempt for a file already open.	File specified for open is already open.
3	Parameter error on call.	Parameter incorrect or required parameter (option) missing.
36	Parameter for open is incorrect.	Check OPEN statements or DCB for errors.
31	Program not found.	Program specified not found on available volumes.
44	Printer fault (may be turned OFF).	Check connections, power, ribbon, etc.
45	Printer not available.	Check connections, power, ribbon, etc.

Error Code	Description	Explanation/Action
42	Printer not ready.	Check connections, power, ribbon, etc.
43	Printer out of paper.	Check printer's paper supply.
29	Read attempt outside of file limits.	Use valid record numbers.
47	Required command parameter not found.	Required option or argument missing in command.
4Ø	SEEK error.	Data cannot be read from diskette -- faulty media. Try a different diskette.
14Ø	Undefined	
141	Undefined	
142	Undefined	
32	Unknown drive number (filespec).	Drive number specified not a valid drive number.
51-127	Unknown Error Codes.	
139	User Stack Overflow	Overflow occurred in user stack during SETBRK SVC or SETTRP SVC operation.
13	Write attempt to a read only file.	File was opened for read only, not read/write.
14	Write fault on disk I/O (input/output).	Error occurred during a write operation -- try a different diskette. If problem continues - RSSC.
143	SVC Table Overflow	For multi-user only.

BOOT ERROR TABLE

Error Code	Description	Explanation/Action
BOOT ERROR CK	Defective ROM (Checksum Error)	Contact a Radio Shack Service Center
BOOT ERROR CT	Defective CTC Chip	Contact a Radio Shack Service Center
BOOT ERROR DC	<ol style="list-style-type: none"> 1. Defective diskette. 2. Floppy disk expansion unit not on. 3. Defective FDC Chip or Drive. 	<ol style="list-style-type: none"> 1. Try a different diskette. 2. Turn on floppy disk expansion unit. 3. Contact a Radio Shack Service Center.
BOOT ERROR DM	Defective DMA Chip	Contact a Radio Shack Service Center
BOOT ERROR DØ	Drive not ready. <ol style="list-style-type: none"> 1. Improperly inserted diskette. 2. Defective diskette. 3. Defective drive. 	<ol style="list-style-type: none"> 1. Insert diskette again and reset the Computer. 2. Try a different diskette. 3. Contact a Radio Shack Service Center.
BOOT ERROR HA	Controller Error. Aborted command: Problem during boot-up of hard disk.	Re-initialize hard disk or contact a Radio Shack Service Center.
BOOT ERROR HC	CRC Error. Invalid data in data field.	Re-initialize hard disk or contact a Radio Shack Service Center.

Error Code	Description	Explanation/Action
BOOT ERROR HD	Controller Error. Busy not reset.	Re-initialize hard disk or contact a Radio Shack Service Center.
BOOT ERROR HI	CRC Error. Invalid data in ID field.	Re-initialize hard disk.
BOOT ERROR HM	Data address mark not found.	Re-initialize hard disk
BOOT ERROR HN	ID not found. No Boot Track.	Re-initialize hard disk
BOOT ERROR HØ	Track Ø Error on hard disk 1. Didn't find Track Ø before time-out. 2. Secondary hard disk drives not turned on	1. Reset the Computer 2. Turn on your secondary hard disk drives
BOOT ERROR HT	Time-out while waiting for READY. 1. Hard disk drive not powered up. 2. Hard Disk Drive isn't turned ON and ready within 1Ø seconds after Computer. 3. Hard Disk Drive is disconnected.	1. Follow correct power up procedure: turn on hard disk first. 2. Reset the Computer 3. Connect the hard disk drive or operate under floppy disk control

Error Code	Description	Explanation/Action
BOOT ERROR LD	Lost Data during read -- FDC (Floppy Disk Controller) or Drive fault.	Try another TRSDOS diskette or contact a Radio Shack Service Center.
BOOT ERROR MF	Defective RAM in address range H'10000'-H'7FFF'.	Contact a Radio Shack Service Center.
BOOT ERROR MH	Defective RAM in address range H'80000'-H'FFFF' (64K Computers only)	Contact a Radio Shack Service Center.
BOOT ERROR ML	Defective RAM in address range H'00000'-H'0FFF'.	RSSC
BOOT ERROR PI	Defective PIO Chip	RSSC
BOOT ERROR RS	The diskette in Drive 0 is not Radio Shack Model 16 or Model II Operating System format.	<ol style="list-style-type: none"> 1. Insert a TRSDOS, TRSDOS-II or TRSDOS-16 formatted diskette into Drive 0 and reset the Computer. 2. Remove diskettes and turn power off. Wait 15 seconds and turn on the system again.
BOOT ERROR SC	CRC Error. Invalid data on diskette or defective diskette.	Try a different diskette.

Error Code	Description	Explanation/Action
BOOT ERROR TK	Record not found on bootstrap track. Improperly formatted or defective diskette.	Re-format your diskette or try a different diskette.
BOOT ERROR Z8 (68000 Memory Fault at Page Address=xxxxxxx)	Defective CPU. Memory Fault. xxxxxx is the hex addr of 1K block where fault occurred.	RSSC. RSSC
NOT A SYSTEM DISK	Diskette in Drive 0 isn't a TRSDOS, TRSDOS-II or TRSDOS-16 Operating System Diskette	Insert a TRSDOS, TRSDOS-II, or TRSDOS-16 Operating System diskette into Drive 0

APPENDIX B / The Configuration Command File

Whenever TRSDOS-16 starts up or is reset, it looks for a file named CONFIG16/SYS. This "configuration command file" tells TRSDOS-16 to link in certain extra operating system programs.

CONFIG16/SYS should be present on the primary disk device (Drive 0 or Drive 4). It contains these directives:

```
INCLUDE RUNCOBOL
INCLUDE DEBUG
END
```

which tell TRSDOS-16 to link in the RUNCOBOL program and the DEBUG program.

You may create your own CONFIG16/SYS file, or modify the existing one to meet your needs, by using EDIT16.

SAVING THE EXISTING CONFIG16/SYS FILE

Before creating a new CONFIG16/SYS file, you will probably want to save the existing one by renaming it.

For example:

```
RENAME CONFIG16/SYS:0 TO DEBCOB/CFG:0
```

renames the default configuration file. (The new filename tells you it includes both DEBUG and RUNCOBOL modules.

After renaming the existing CONFIG16/SYS file, you can create a new one.

Since you "saved" the existing file, you can use it again. To do this, rename the present CONFIG16/SYS file (if you want to save it) and then rename DEBCOB/CFG back to CONFIG16/SYS:

```
RENAME DEBCOB/CFG:0 TO CONFIG16/SYS:0
```

TO EDIT OR CREATE CONFIG16/SYS

Use EDIT16 to edit or create a CONFIG16 command file.

1. Type:

```
EDIT16 <ENTER>
```

and the Editor's Command mode prompt will be displayed:

```
C?.....
```

2. To insert commands into the command file, you must get in the Insert mode, type:

```
IN <ENTER>
```

The Editor will display the I? prompt, indicating that you are in the Insert mode.

3. You are now ready to insert the names of the programs you want linked to TRSDOS-16.

Comments may be used. They are indicated by an asterisk (*) in the first column.

The key word **INCLUDE** tells TRSDOS-16 the name of the program. The syntax for the **INCLUDE** statement is:

```
INCLUDE filename
```

The default extension for filespec is **/SYS**; it is optional. Drive numbers, disk ID and Passwords are not permitted.

Programs are loaded sequentially in memory in the order they are encountered in the CONFIG16/SYS file. The maximum number of programs that may be **INCLUDED** is 15.

The programs must be resident on the primary drive (Drive 0 or Drive 4).

The list is concluded with an **END** statement.

For example:

```
* This is the Configuration File for DEBUG
INCLUDE DEBUG
END
```

tells TRSDOS-16 to link only the DEBUG program. The first line is a comment and is not executed by TRSDOS-16

4. When you are finished inserting, press <ENTER> to exit the Insert Mode.
5. Save the file with the following command:

```
SA CONFIG16/SYS <ENTER>
```
6. You now have a new CONFIG16 command file that TRSDOS-16 will use when it powers up or resets.

CONFIGURATOR ERROR MESSAGES

When the Configurator lists a line generating an error, it prints an error message directly underneath the line number. Preceding the message, it inserts three asterisks.

In cases of certain syntax or file I/O errors, the Configurator also marks, with a dollar sign (\$), where in the line the error occurred.

For example:

```
Ø11 INCLUDE RUNCOBOL
    $
*** Illegal Command
```

shows a syntax error in the spelling of INCLUDE.

There are three categories of Configurator error messages:

- A. Configuration Control File Errors
- B. Configuration Command Errors
- C. Completion Errors

A. Configuration Control File Errors

These errors are FATAL. If one of these errors occur, the Configurator could not properly execute the CONFIG16/SYS file. TRSDOS-16 will still be displayed but certain defaults will have occurred:

1. No programs have been INCLUDED
2. DEBUG is kept resident (if available)
3. Any memory not occupied by DEBUG and the resident Operating System is available to the user.

Use EDIT16 to correct the error (or create a new configuration file) and reset the system.

Can't Open CONFIG16/SYS: TRSDOS Error Code = nnn

Look up TRSDOS-16 Error Code nnn in Appendix B and take appropriate action.

Can't configure system: File CONFIG16/SYS not proper format

The CONFIG16/SYS file is not a VLR type file.

Can't configure system: File CONFIG16/SYS not found

TRSDOS-16 could not find the CONFIG16/SYS file.

I/O Error on File CONFIG16/SYS: TRSDOS Error Code = nnn

Look up TRSDOS-16 Error Code nnn in Appendix B and take appropriate action.

B. Configuration Command Errors

These errors occur when a command cannot be processed by the Configurator. If one of these error occurs, the Configurator will continue to process the command lines. However, the desired result of the configuration file may not have been accomplished. For example, an INCLUDE file may have been left out.

Can't INCLUDE program: TRSDOS Error Code = nnn

The Configurator cannot load the program because of an I/O error. Look up the TRSDOS-16 Error Code in Appendix B.

Can't INCLUDE program: Out of Memory

More resident programs were requested than will fit into user memory.

Can't INCLUDE program: Program already configured

This error occurs any time a program is included twice.

Too many INCLUDED programs: this request ignored

This error occurs if more than 15 programs are included. The command line that is flagged is ignored (treated as a comment).

C. Completion Error***** CONFIGURATION ABORTED *****

This message appears when the configurator could not finish processing the CONFIG16/SYS file because of an I/O error.

ABOUT THE CONFIGURATOR

The Configurator is invoked whenever the 68000 processor is initialized. It performs several important functions:

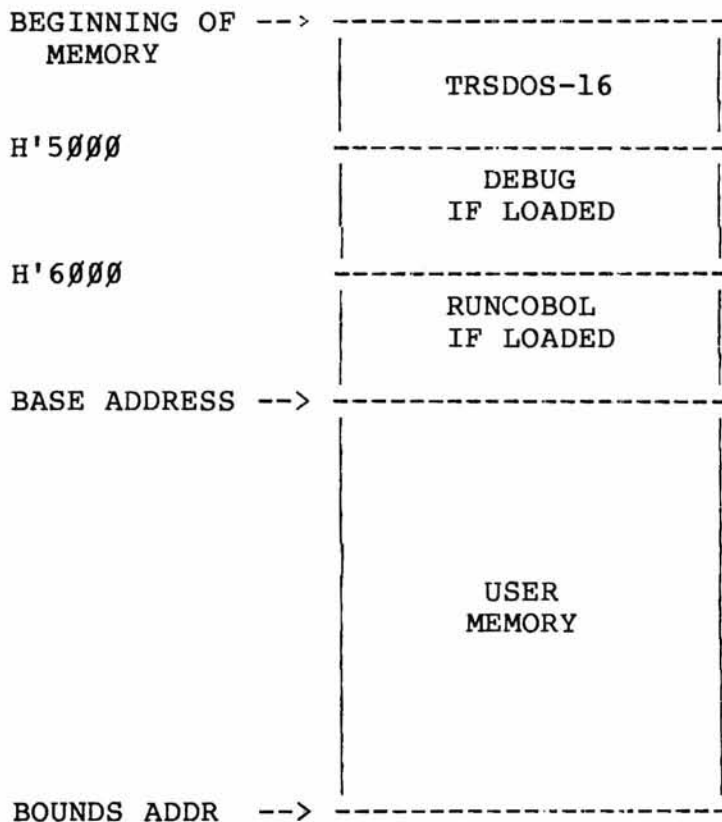

- . It determines whether the machine debugger is required. If not, it is eliminated from memory. This gives you an extra 4K of memory.
- . It initializes traps and interrupts. This eliminates the need to keep extra code resident in memory.
- . It loads in resident programs as specified in the CONFIG16/SYS file.
- . It reads the AUTO file and passes it to TRSDOS-16 for execution.

The Configurator is linked in at the end of user memory and occupies 4K of memory. Upon system initialization, it moves itself to the top of physical memory. This is because the resident programs will be loaded at low address, overlaying the original configurator.

Next the Configurator begins to load the resident programs requested in the CONFIG16/SYS file (i.e., DEBUG and RUNCOBOL). It loads these programs sequentially starting at the beginning of user memory and up to the beginning of where the Configurator has relocated itself. This guarantees that after loading is complete, the user has at least 4K of memory available (the size of the Configurator).

After configuration is complete, the Configurator is no longer necessary and is overwritten.

APPENDIX C / Memory Map

MEMORY CHART

User memory begins at H'5000 if the Debugger is not configured and at H'6000 if the Debugger is configured.

APPENDIX D / ASCII Character Codes

Code		Character	
Dec.	Hex.	Keyboard	Video Display
00	00	HOLD	
01	01	F1 CTRL A	Turns on blinking cursor
02	02	F2 CTRL B	Turns off cursor
03	03	BREAK CTRL C	
04	04	CTRL D	Turns on steady cursor
05	05	CTRL E	
06	06	CTRL F	
07	07	CTRL G	
08	08	BACKSPACE CTRL H	Backspaces cursor and erases character
09	09	TAB CTRL I	Advances cursor to next 8-character boundary
10	0A	CTRL J	Line feed
11	0B	CTRL K	Cursor to previous line
12	0C	CTRL L	
13	0D	ENTER CTRL M	Carriage return
14	0E	CTRL N	Dual routing on
15	0F	CTRL O	Dual routing off
16	10	CTRL P	
17	11	CTRL Q	
18	12	CTRL R	
19	13	CTRL S	
20	14	CTRL T	Homes cursor to upper left
21	15	CTRL U	
22	16	CTRL V	
23	17	CTRL W	Erases to end of line
24	18	CTRL X	Erases to end of screen
25	19	CTRL Y	Sets white-on-black mode
26	1A	CTRL Z	Sets black-on-white mode
27	1B	ESC	Clears screen, homes cursor

* **BREAK** is always intercepted. It will never return a code 3 to the user program.

Code		Character	
Dec.	Hex.	Keyboard	Video Display
28	1C	←	Moves cursor back
29	1D	→	Moves cursor forward
30	1E	↑	Sets 80-character mode and clears Display
31	1F	↓	Sets 40-character mode and clears Display
32	20	SPACE BAR	∅

APPENDIX F / MODEL 16 & ENHANCED MODEL II SPECIFICATIONS

SPECIFICATIONS

The Radio Shack TRS-80 Model 16 and Enhanced Model II are disk-based computer systems with two major components:

1. A Display Console with up to two built-in, double-sided, double-density floppy disk drives (Model 16) or one built-in, single-sided floppy disk drive (Enhanced Model II).
2. A separate keyboard enclosure which can be positioned for maximum operator comfort and efficiency

The operating system software is loaded from a system diskette in Drive 0 or Drive 4 by a built-in ROM "bootstrap" program.

PROCESSORS

Input/Output Processor System:

- Z80-A based with 64K bytes of random access memory
- Independent bus can support all the standard system boards
- Emulation mode allows you to execute programs previously developed for the TRS-80 Model II without changing them first.

Computational Processor System:

- 68000 based with either 128K or 256K (384K or 512K bytes on a Model 16) of RAM
- Independent bus can support multiple bus masters

The two processors share the computing load from the application programs (the Z80-A based processor performs input/output tasks while the 68000 based processor performs computational tasks).

VIDEO DISPLAY**LSI Controller Chip:**

- . Frees the input/output (Z80-A based) processor from much of the overhead required to update and maintain the video display.

Four Modes:**Model 16:**

- . green on black (normal)
- . black on green (reversed)
- . 80 characters by 24 lines
- . 40 characters by 24 lines

Enhanced Model II:

- white on black (normal)
- black on white (reversed)
- 80 characters by 24 lines
- 40 characters by 24 lines

Displayable Characters:

- . Full ASCII set
- . 32 graphics characters

KEYBOARD

- . LSI Controller frees the input/output (Z80-A based) processor from keyboard scan and related tasks
- . Located in separate case for convenience
- . Connected to Display Console via a built-in cable exiting the bottom front of the Console
- . Standard typewriter keys, repeat key and two general-purpose function keys
- . Four modes: 1) Unshift; 2) Shift; 3) Caps; 4) Control

FLOPPY DISK DRIVES**Minimum:**

- . Model 16: One (if system contains a hard disk) or two built-in 8" double-sided floppy disk drives
- . Enhanced Model II: One built-in 8" single-sided floppy disk drive

Maximum:

- . Model 16: Two built-in and two external 8", double-sided floppy disk drives
(Disk Expansion Unit needed for two external drives)
- . Enhanced Model II: One built-in and three external 8" single-sided floppy disk drives
(Disk Expansion Unit needed for three external drives)

Storage Capacity:

- . 1,256,704 bytes per double-sided diskette (for User Data Capacity, see Operating System Manual.
- . 625,920 bytes per single-sided diskette (for User Data Capacity, see Operating System Manual)

Diskette Organization:

- . 154 tracks per double-sided diskette, 77 tracks per single-sided diskette
- . 32 (0-31) sectors per track -- will vary with operating system software. See TRSDOS Reference Manual, Technical Information section for more details.
- . 256 bytes per sector (except track 0 which has 128 bytes per sector) -- varies with operating system software. See TRSDOS-16 and the TRSDOS/Model II Reference Manuals, Technical Information sections for more details.

Data Transfer Rate:

- . 500,000 bits per second (except track 0 which has 250,000 bps)

Required Media:

- . Model 16: Radio Shack Double or Single-sided, 8" Floppy Diskettes
- . Enhanced Model II: Radio Shack Single-sided, 8" Floppy Diskettes

Preventative Maintenance Interval:

- . Typical usage (3,000 Power-on hours per year):
Every 8000 Power-On Hours
- . Heavy usage (8,000 Power-on hours per year):
Every 5000 Power-On Hours

Diskette Life:

3.5 million passes per track
Usually limited by improper handling. Follow
handling recommendations for maximum use.

POWER SUPPLY**Power Requirements:**

- . 105 - 130 VAC, 60 Hz
- . 240 VAC, 50 Hz (Australian)
- . 220 VAC, 50 Hz (European)
- . Grounded outlet

Maximum Current Drain:

- . 2.0 Amps

Typical Current Drain:

- . 1.5 Amps

OPERATING TEMPERATURE

- . 32 to 110 degrees Fahrenheit
- . 0 to 43 degrees Centigrade

PERIPHERAL INTERFACES**Standard:**

- . Serial port A (RS232-C)
- . Serial port B (RS232-C)
- . Parallel input/output channel, for connection to TRS-80 standard parallel interface line printers
- . Floppy disk input/output channel for connection of a Disk Expansion Unit

Optional:

- . Hard Disk Drive Interface
- . ARCNET Interface
- . Graphic Board

Serial Interface**Two Channels**

- . Channel A allows asynchronous or synchronous

- transmission.
- . Channel B allows asynchronous transmission only.
- . Both conform to the RS-232-C standard.
- . Both use the DB-25 connectors on the back of the Display Console.

The DB-25 connector pin-outs and signals available are listed below.

CHANNEL A		CHANNEL B	
STANDARD	PIN #	STANDARD	PIN #
RS-232C SIGNAL		RS-232-C SIGNAL	
I/O TRANSMIT S.E.T.	15	GROUND	1,7
GROUND	1,7	RECEIVED DATA	3
RECEIVED DATA	3	RECEIVER XMITTER CLOCK	17
RECEIVER CLOCK	17	DATA SET READY	6
TRANSMIT CLOCK	24	CLEAR-TO-SEND	5
DATA SET READY	6	CARRIER DETECT	8
CLEAR-TO-SEND	5	TRANSMIT DATA	2
CARRIER DETECT	8	REQUEST-TO-SEND	4
TRANSMIT DATA	2	DATA TERMINAL READY	20
REQUEST-TO-SEND	4		
DATA TERMINAL READY	20		

Parallel Interface

Connection to a line printer via the 34-pin connector on the back panel of the Display Console.

Eight data bits are output in parallel.

Four data bits are input.

All levels are TTL compatible.

The connector pin-outs and signals available are listed on the next page.

SIGNAL	FUNCTION	PIN
STROBE	1 microsecond pulse to clock the data from processor to printer	1
DATA 0	Bit 0 (lsb) of output data byte	3
DATA 1	Bit 1 of output data byte	5
DATA 2	Bit 2 of output data byte	7
DATA 3	Bit 3 of output data byte	9
DATA 4	Bit 4 of output data byte	11
DATA 5	Bit 5 of output data byte	13
DATA 6	Bit 6 of output data byte	15
DATA 7	Bit 7 (msb) of output data byte	17
ACK*	Input to Computer from Printer, low indicates data byte received	19
BUSY	Input to Computer from Printer, high indicates busy	21
PAPER EMPTY	Input to Computer from Printer, high indicates no paper -- if Printer doesn't provide this, signal is forced low	23
SELECT	Input to Computer from Printer, high indicates device selected	25
PRIME*	Output to Printer to clear buffer and reset printer logic	26
FAULT*	Input to Computer from Printer low indicates fault (paper empty, light detect, deselect, etc.)	28
GROUND	Common signal ground	2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 24, 27, 31, 33
NC	Not connected	29, 30, 32, 34

*These signals are active-low.

APPENDIX G / SVC Quick Reference List

NAME	DESCRIPTION	NO.
ACTL	Control Channel A	100
ARCV	Channel A Receive	96
ATX	Channel A Transmit	97
BCTL	Control Channel B	101
BRCV	Channel B Receive	98
BTX	Channel B Transmit	99
CLOSE	Terminates output to specified file.	42
CLOSEF	Terminates output to all open files except OPENDO file	133
CLREXIT	Clear user memory and jump to TRSDOS-16 Ready	257
CURSOR	Position cursor	10
DATE	Returns the real-time (time/date)	45
DEBUG	Load the Debugger	259
DIRRD	Allows a specific record in a FLR file to be read.	35
DIRWR	Allows a specific record in a FLR file to be read.	44
DISMOUNT	Logically disconnect a MOUNTed disk device	139
DOSCMD	Execute TRSDOS-16 command and return to TRSDOS-16 Ready	270
DUMP	Writes a 68000 format program file from 68000 memory.	130
ERRMSG	Returns an 80-byte descriptive error message for the requested error number	52

NAME	DESCRIPTION	NO.
ERROR	Causes the error message referred to by ERROR NUMBER to be printed on the video display.	39
EXECUTE	Execute program.	263
HLKEY	Enable / Disable HOLD key.	29
JP2DOS	Jump to TRSDOS-16 Ready.	264
KBCHAR	Strobes the keyboard and returns with or without a character.	4
KBINIT	Initializes the keyboard input driver.	1
KBLINE	Inputs a line from the keyboard into a buffer and echoes the line to the display.	5
KILL	Deletes the specified file from the directory.	41
LOAD	Loads a 68000-format program into the user memory.	131
LOCATE	Returns the number of the current record. (i.e. the last record accessed)	33
MOUNT	Logically connects a disk device	138
MOVBUF	Retrieves and stores an 80-byte buffer	267
OPEN	Handles both the creation and opening of files.	40
OPENDO	Opens and creates a special file not closed by CLOSEF	140
PRCHAR	Sends one character to the Printer.	18
PRCTRL	Lets you select various printer options.	95
PRINIT	Initializes the printer driver	17

NAME	DESCRIPTION	NO.
PRLINE	Sends a line to the Printer.	19
READNX	Reads the next record after the current record.	34
RENAME	Changes the name and/or extension of a file	47
RESET	Same as pressing the RESET switch	129
RS232C	Initialize RS-232C Channel	55
SETBRK	Enable / Disable the BREAK key	269
SETTRP	Set or remove trap vectors	266
UNLOCK	Unlocks a specified record	136
VDCHAR	This routine outputs a character at the current cursor position.	8
VDINIT	Initialize the Video Driver	7
VDLINE	Writes a buffer of data to the display	9
VERSION	Get version of Operating System	137
VIDKEY	Sends a prompting message to the display and then waits for a line from the keybd.	12
WRITNX	Writes the next record after the last record accessed. (i.e., sequentially)	43
